

Cluster cosmology with the NIKA2 SZ Large Program

F. Mayet

on behalf of the NIKA2 Collaboration

Outline

1. Cluster cosmology
The need for high-resolution SZ observations
3. The NIKA2 SZ large program (2018-2023)
Follow-up of 45 Planck(ACT)-discovered clusters
4. First cluster observation with NIKA2
Impact of high-resolution SZ observations
F. Ruppin *et al.*, A&A 2018

Cluster cosmology – Cosmological parameters

After Planck: high-precision cosmological era

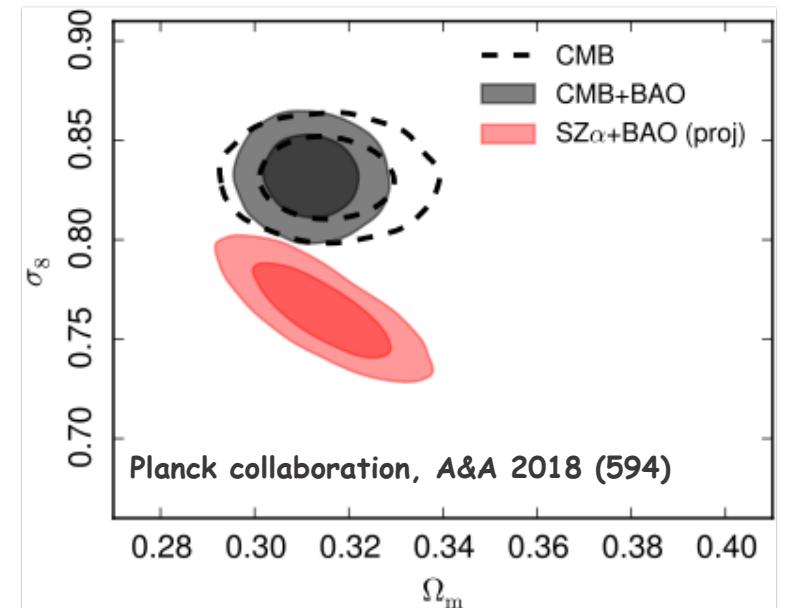

However ...

Tension between CMB and cluster results

- σ_8 Amplitude of the linear power spectrum @ $8 h^{-1} \text{ Mpc}$
- Ω_m Matter density

Explanation

- New physics ?
large-scale structure formation, neutrinos, ...
- Insufficient knowledge of cluster physics, e.g. a wrong estimate of
 - the hydrostatic bias parameter L. Salvati *et al.*, A&A 2018
 - **the scaling relation**
 - **the mean pressure profile** F. Ruppin *et al.*, arXiv:1905.05129

a better understanding of cluster physics is needed

Cluster cosmology - methods

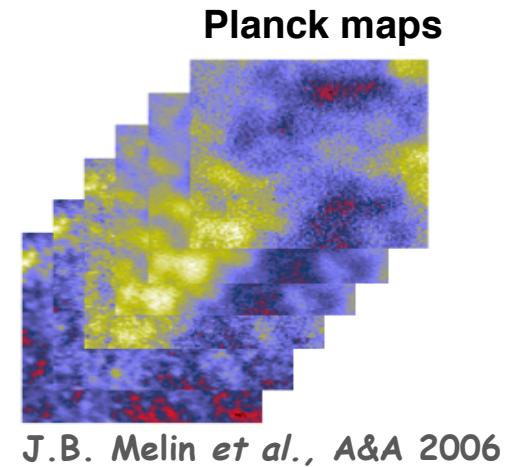

Cosmological survey (Planck, ACT, SPT)

→ Two methods

$$1) \text{ Cluster count } \frac{d^2n}{dMdz}$$

- use a cosmological cluster sample (2000 clusters)
- build a catalog (mass, redshift)
- count the number of clusters per **redshift** and **mass** bin
- compare with prediction of the cosmological model

Planck Collaboration, A&A 2011 & 2014

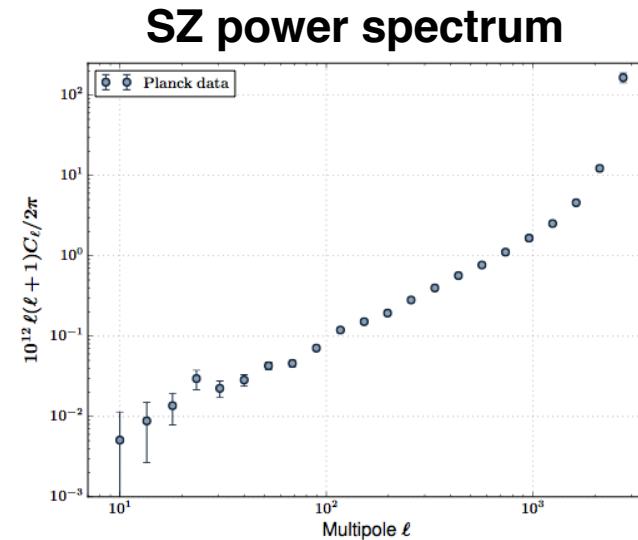

J.B. Melin *et al.*, A&A 2006

$$2) \text{ SZ power spectrum } C_\ell^{\text{SZ}}$$

- use a SZ map (full sky)
- compute the power spectrum
- compare with prediction of the cosmological model

Planck Collaboration, A&A 2014

→ two tools are needed

Cluster cosmology - tools

Information needed for each cluster, e.g. cluster count $\frac{d^2n}{dMdz}$

- redshift (optical follow-up)
- **cluster mass** ... must be inferred from the **SZ observable**

Integrated Compton parameter

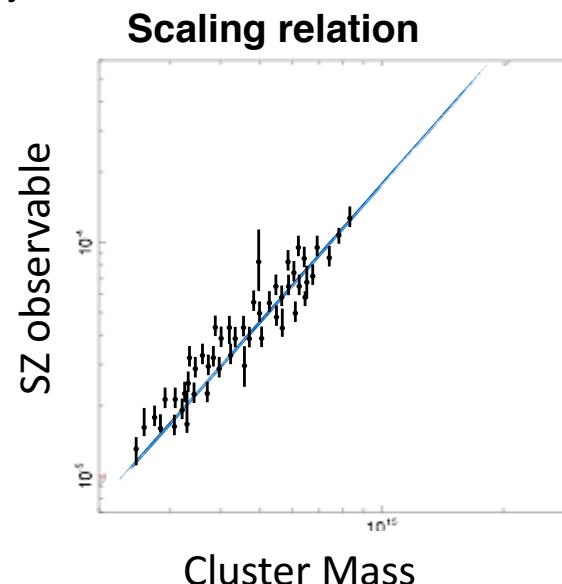

$$Y_{500} \propto \int_0^{R_{500}} P_e d^3r$$

R_{500} : radius of a sphere containing 500 times the critical density

Y_{500} is the only information for a cosmological survey

a **scaling relation**
is needed to
estimate the cluster mass

Cluster cosmology – scaling relation

The scaling relation must be **calibrated**

... with a cluster sample that is **representative** of the whole population

... for which both the observable (Y_{500}) and the mass is known

$$M_{\text{HSE}}(r) \propto \frac{r^2}{n(r)} \times \frac{dP(r)}{dr}$$

with the hypothesis of
HydroStatic Equilibrium

$P(r)$ Pressure profile (from SZ observation) $y_{\text{SZ}} \propto \int_{\text{LOS}} P_e d\ell$

$n(r)$ Density profile (from X-ray observation) $S_X \propto \frac{1}{(1+z)^4} \int n_e^2 \Lambda d\ell$

Nota
Bene

X-ray spectroscopy also provides the Temperature
 → Pressure directly from X-ray observations ($P_e \propto n_e T_e$)
 → Great ... but very time consuming at high redshift (prohibitive)

Useful for comparison when known

Cluster cosmology – scaling relation

Currently, the scaling relation is **calibrated** with

- 71 clusters
- Redshift below 0.45
- Mass from X-ray observation only (with spectroscopy)

Planck Collaboration et al., A&A 2016

- → Planck scaling relation
- → applied to the whole population

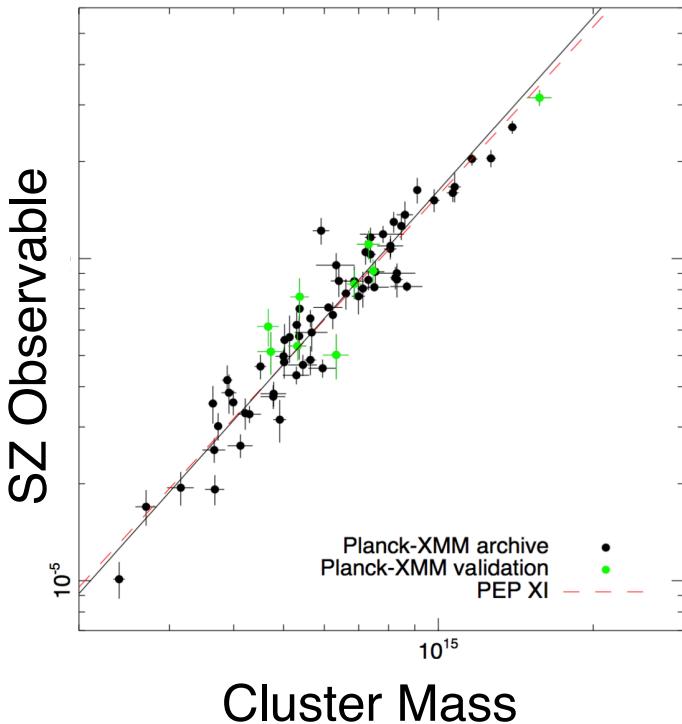

However, the scaling relation may **depend** on the

- redshift range
- dynamical state (merger)
- morphology (departure from sphericity)

To study this tool

- High-resolution observation of sample of clusters is needed
- → NIKA2 SZ Large Program

Planck Scaling relation

Cluster cosmology – mean pressure profile

Mean pressure profile $\mathbb{P}(r)$

→ another tool to exploit a (cosmological) cluster survey

For instance,

In cluster count analyses: $\mathbb{P}(r)$ is needed to measure the integrated SZ flux of each cluster

J.B. Melin et al., A&A 2006

Self-similarity

Once scaled (mass and radius), clusters of galaxies are supposed to be self-similar

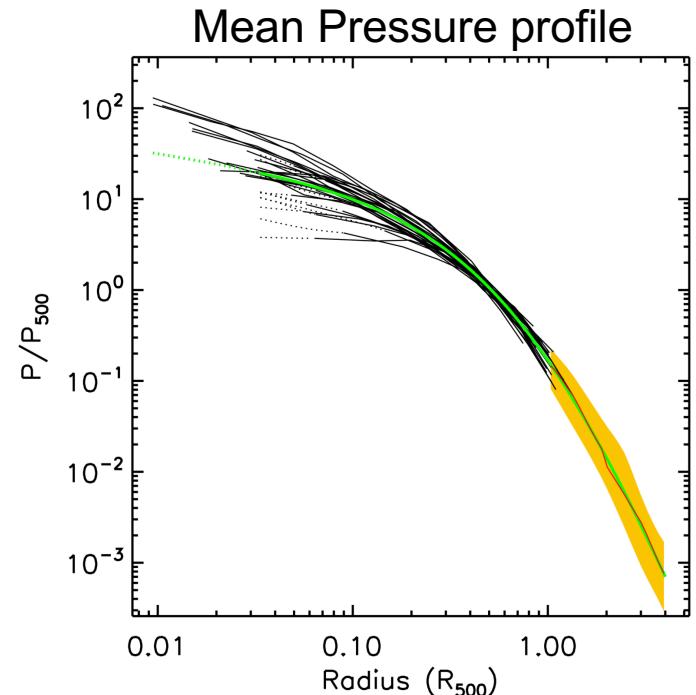

→ $\mathbb{P}(r)$ may be applied to the whole population

Universal Pressure Profile

→ $\boxed{\mathbb{P}(r/R_{500}) = P_e(r)/P_{500}}$

gNFW $P_e(r) = \frac{P_0}{\left(\frac{r}{r_p}\right)^c + \left[1 + \left(\frac{r}{r_p}\right)^a\right]^{\frac{b-c}{a}}}$

P_0, a, b, c, \dots parameters that defines $\mathbb{P}(r)$

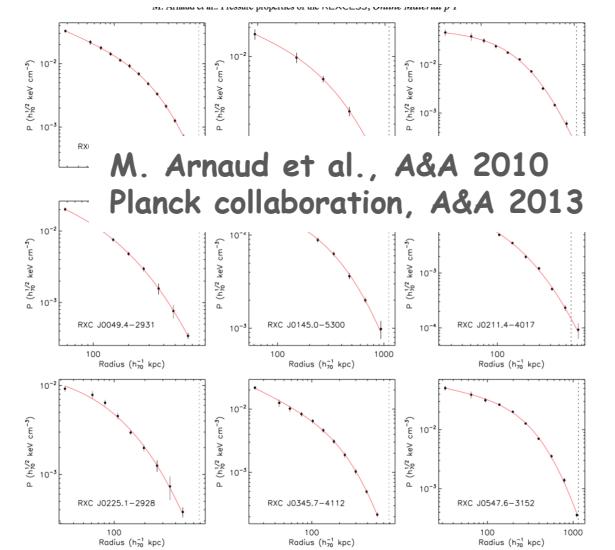

M. Arnaud et al., A&A 2010
Planck collaboration, A&A 2013

Cluster cosmology – mean pressure profile

Currently, the most widely used profile has been evaluated with

- 33 clusters
- @ low redshift ($z < 0.2$) and high mass ($> 10^{14} M_{\odot}$)
- Profiles obtained with X-ray information only (spectroscopy)

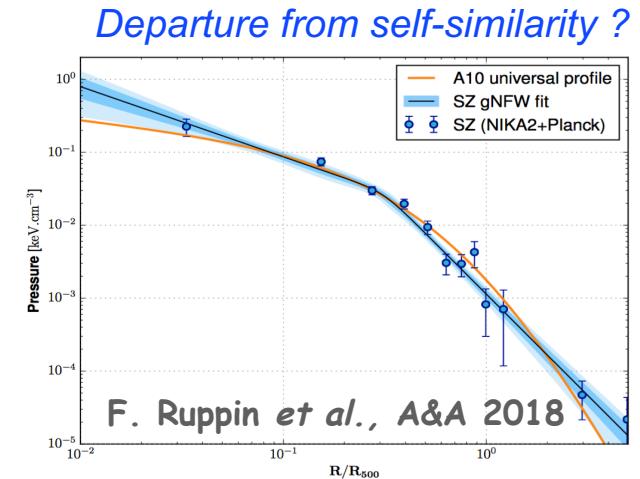

However, the mean pressure profile may **depend** on the

- redshift range
- dynamical state (merger → **overpressure**)
- morphology (departure from sphericity)

*Validity of self-similarity
at high redshift ?*

To study this tool

- High-resolution observation of sample of clusters is needed
- →NIKA2 SZ Large Program

Cluster cosmology – conclusion

To assess results in cluster cosmology

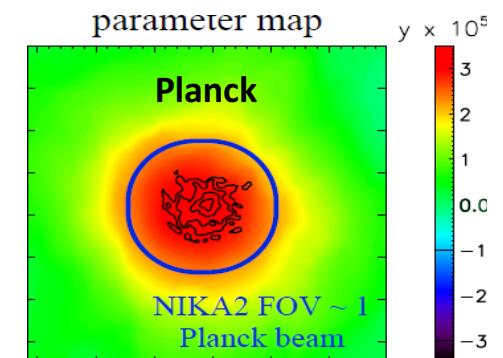

The scaling relation and the mean pressure profile
must be studied with a
cluster sample covering
a wide range in mass up to high redshift ($z \sim 1$)

High-resolution SZ observations are needed

to study the intra-cluster medium:

- dynamical state (merger)
- morphology (departure from sphericity)

NIKA2 is able to
resolve inner structures
smoothed by the Planck beam

Planck beam = NIKA2 field of view

Detector wish list for SZ science

- High angular resolution
→ to resolve inner structures
- High sensitivity
→ to reduce integration time
- Large Field of View
→ to map the whole cluster
- More than one frequency band
→ below and above 217 GHz

The NIKA2 SZ large program (2018-2023)

a follow-up of 45 Planck-discovered clusters

- One of the 5 Large Programs of the NIKA2 Guaranteed time
- 300 hours of observations to observe 45 clusters

NIKA2 SZ LP: data & methods

- NIKA2+Planck → **Pressure profile** $P(r)$
 - XMM-Newton → **Density profile** $n(r)$
- } thermodynamic profiles

Mass profile

$$M(r) \propto \frac{1}{n(r)} \times \frac{dP}{dr}$$

Cluster mass (M_{500})

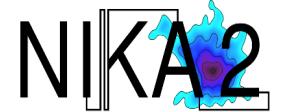

Temperature profile

$$k_B T(r) = \frac{P(r)}{n(r)}$$

Entropy profile

$$K(r) = \frac{P(r)}{n(r)^{5/3}}$$

NIKA2 SZ LP: SZ & X-ray synergy

High-resolution SZ observations must be combined with X-ray observations

→ thermodynamic studies

- Profiles: Pressure, Density, Mass, Entropy
- Integrated quantities: R_{500} , Y_{500} , M_{500}

→ LPSZ products

→ Multi-probe view of clusters

- SZ, X-ray, optical, radio data
- N-body simulation

→ Information on: merging events, shocks, ...

NIKA2 LPSZ requires a synergy
between X-ray and SZ

and also optical data, simulation, ...

NIKA2 SZ LP: sample

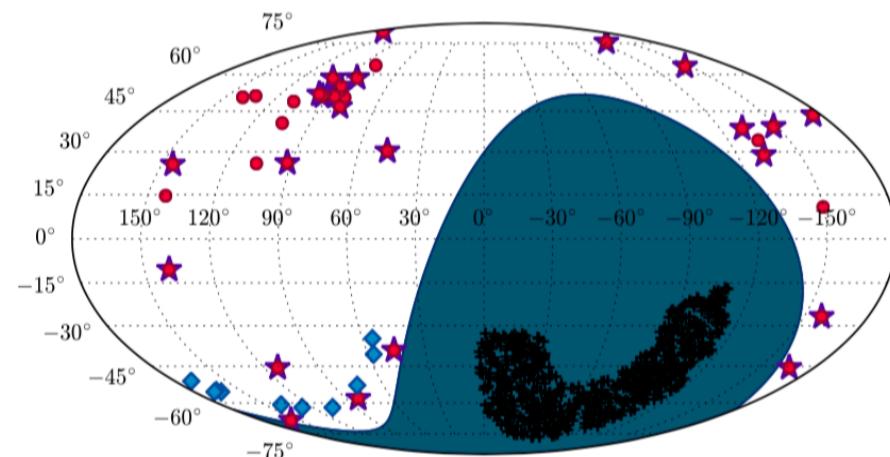

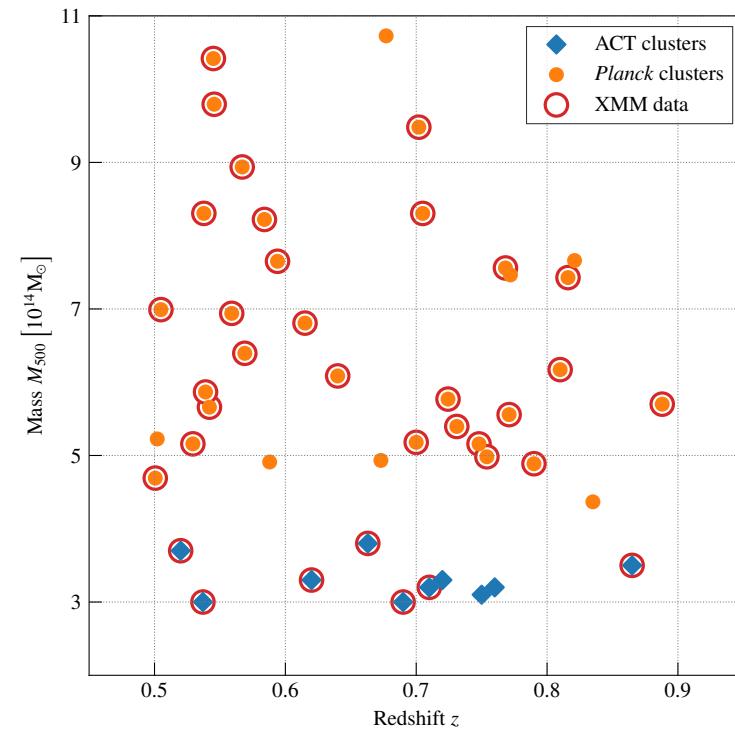

The LPSZ sample

- 45 SZ-selected clusters
 - 10 from ACT catalog
 - 35 from Planck catalog
- 38 with X-ray data
→XMM-Newton follow-up in progress
- 19 have been observed with NIKA2

Constraints

- the sample must be representative
- Warning:
- selection function
 - data analysis
 - data quality : S/N=3 on $P(r)$ @ R_{500}
 - some clusters look (in X-ray images)
 - very diffuse,
 - double/triple

First cluster observation with NIKA2

Impact of high-resolution observations

F. Ruppin *et al.*, A&A 2018

First cluster observation - maps

SZ target

- PSZ2G144: a cluster from the NIKA2 LP sample (Planck catalogue)
- $z = 0.58$
- $M_{500} = 8.22 \times 10^{14} M_\odot$ (Y proxy)
- X-ray data: deep XMM-Newton exposure (~ 60 ksec) :

F. Ruppin *et al.*, A&A 2018

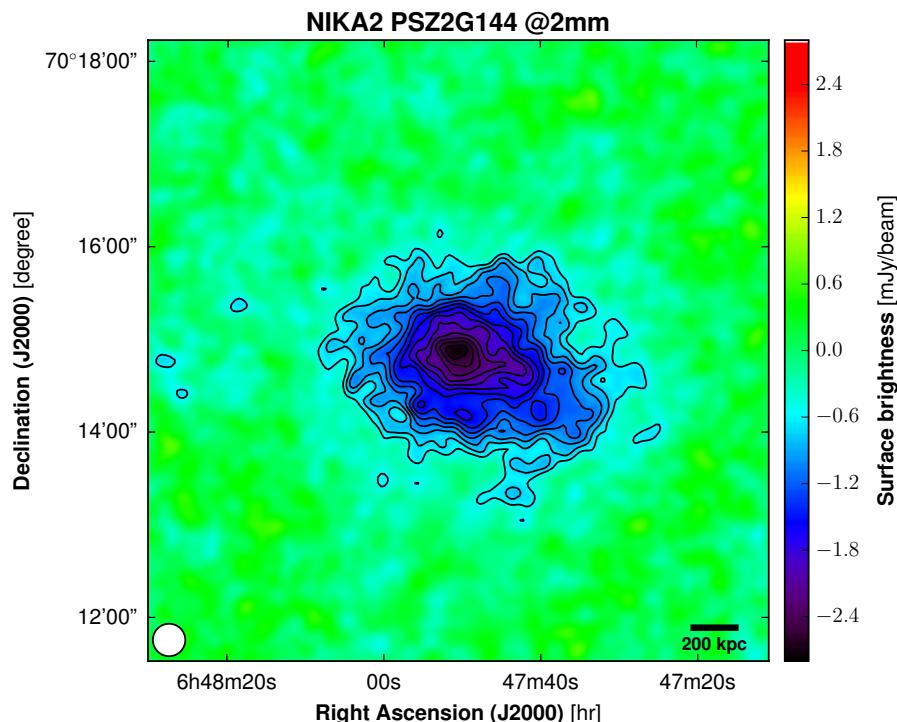

- density (photon count)
- temperature (spectroscopy)

(time consuming)

Observations in April 2017

- Effective observation time: 11 hours (*5.5 times more than requested*) – *Science verification*
- Mean opacity : 0.3 @ 2mm (*bad weather*)

NIKA2 – 150 GHz

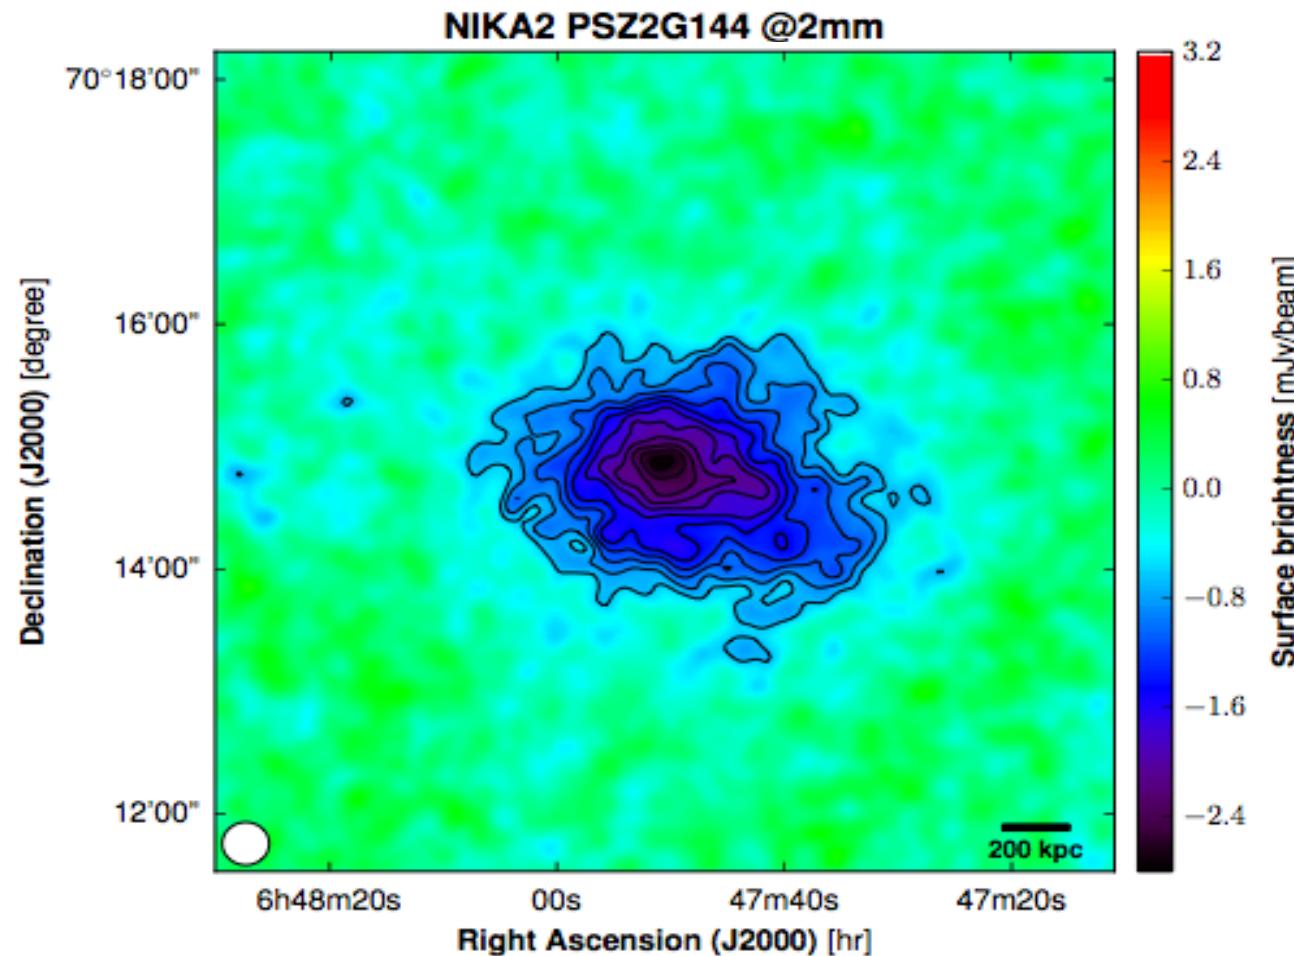

- SZ peak: 13.5σ
- SZ signal up to 1.4 arcmin
- Noise: $203 \mu\text{Jy}/\text{beam}$

First cluster observation – comparison with X-ray

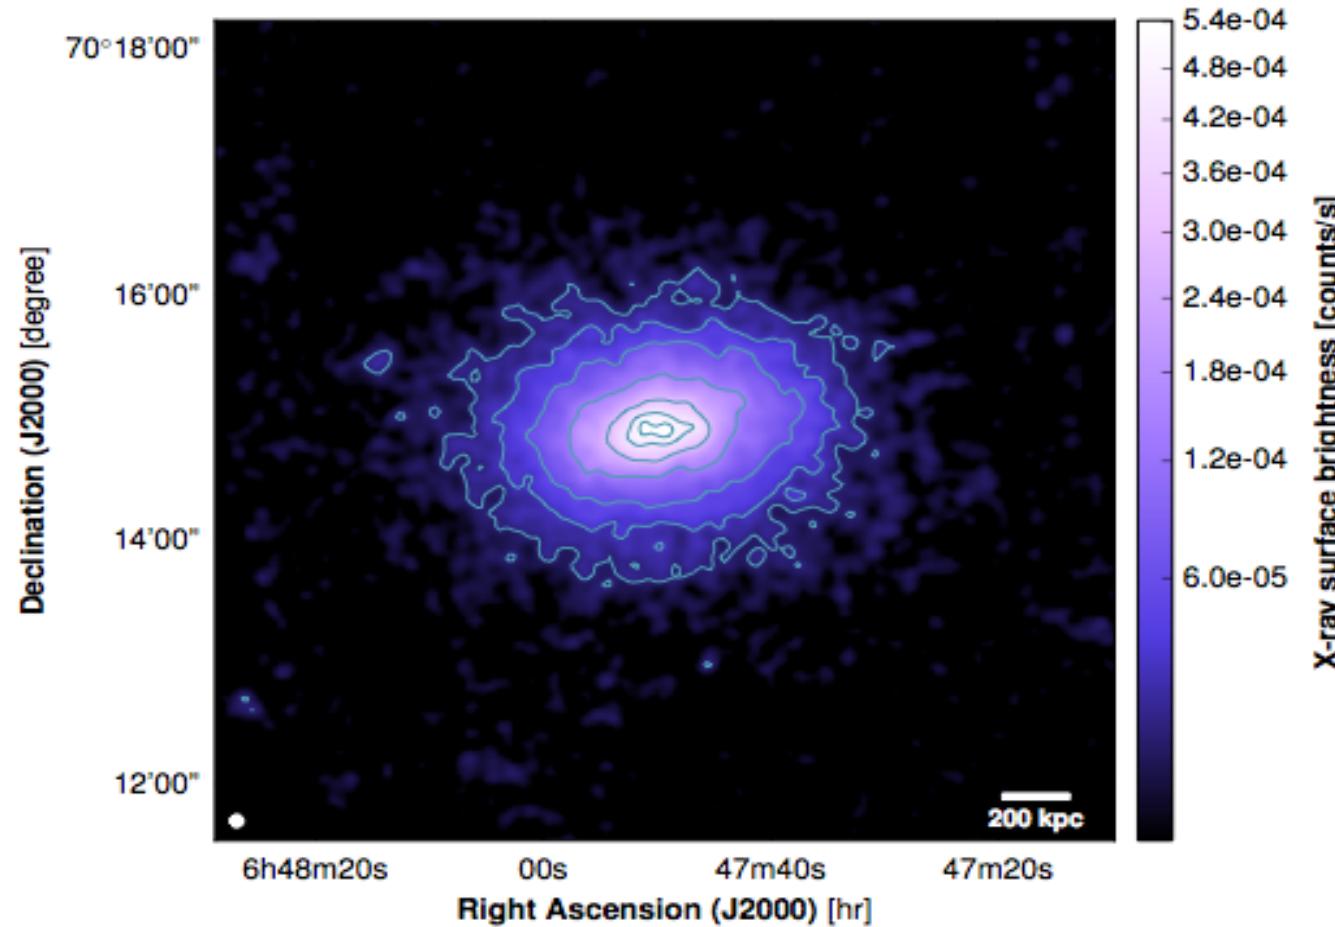

NIKA2 - 11 hours

First cluster observation – comparison with X-ray

XMM-Newton – 60 ks = 16.6 hours

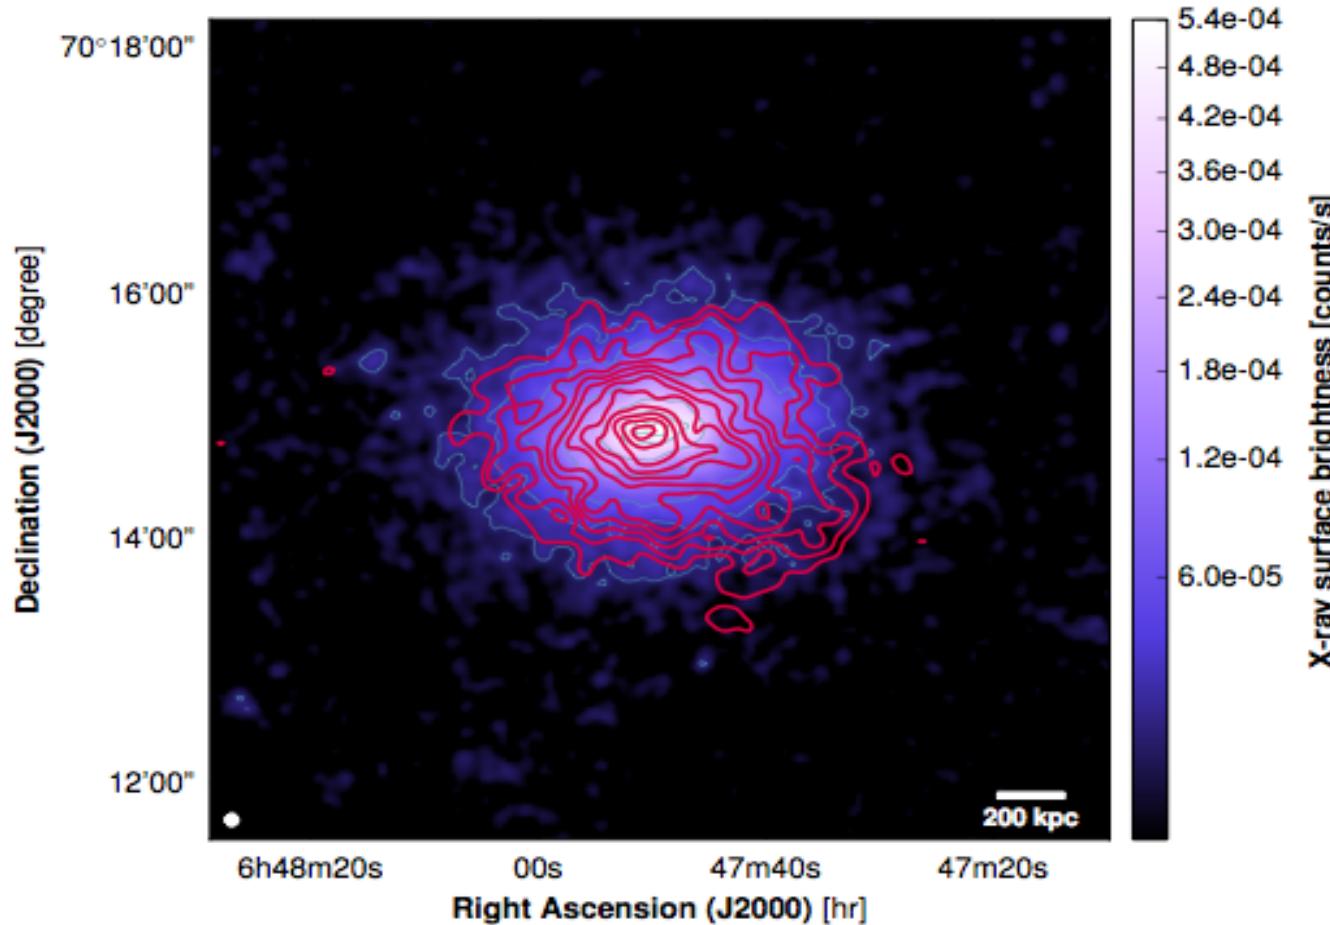

It is crucial to have good X-ray data
in order to perform a thermodynamic study (mass)

First cluster observation – comparison with X-ray

- map: XMM-Newton
- contours: NIKA2

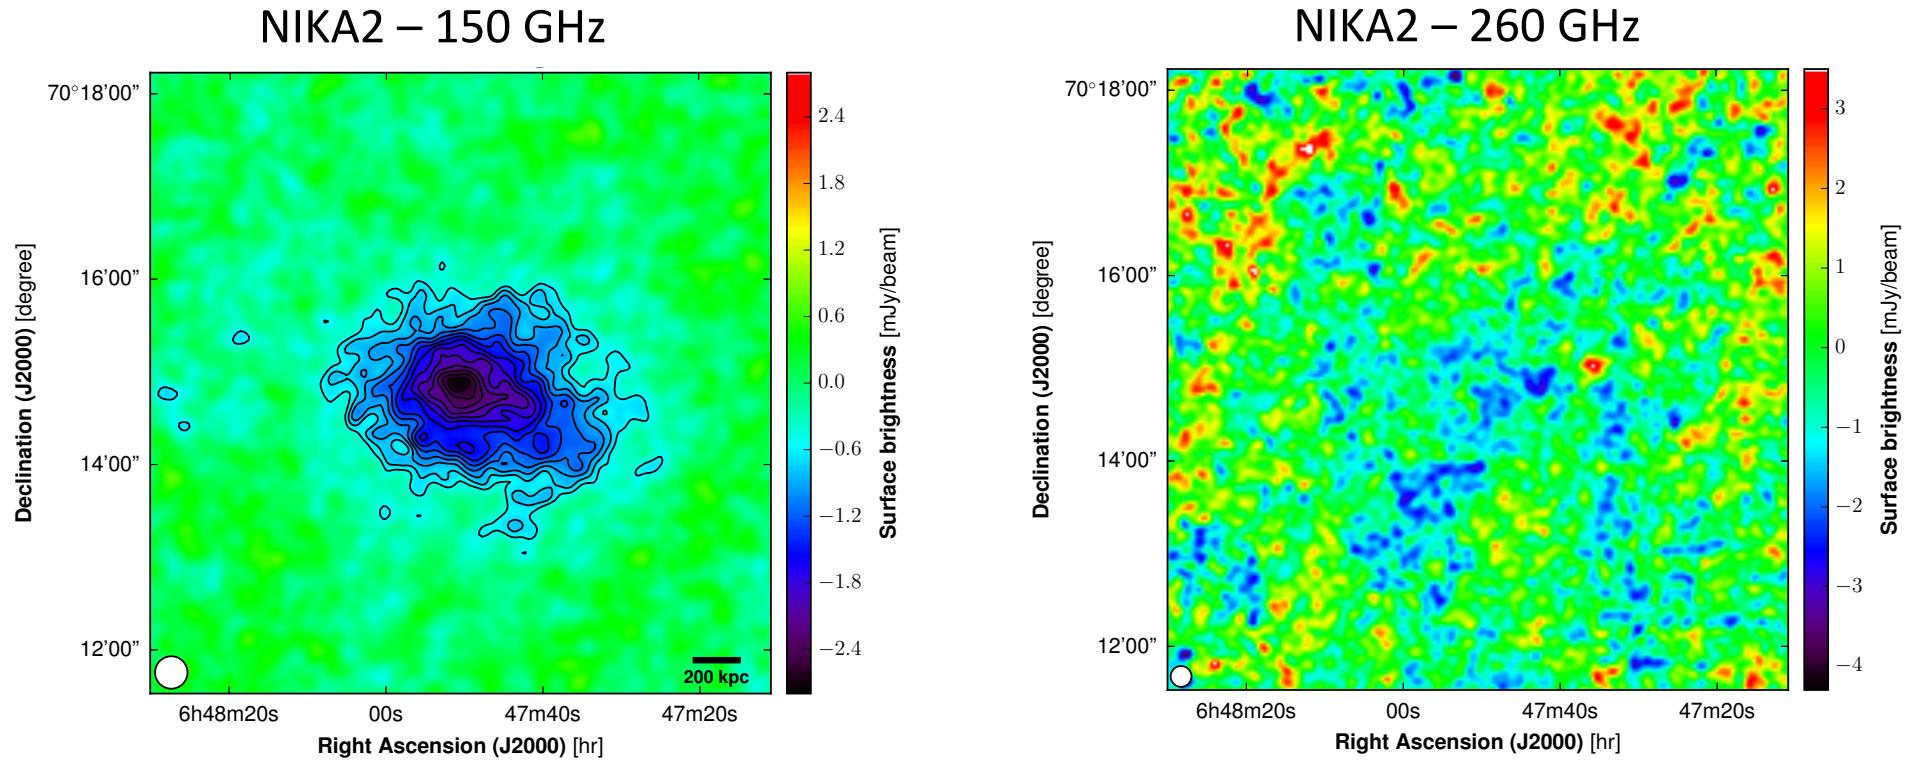

- NIKA2 and XMM extension are comparable
- For the first time, we have SZ and X-ray data at the same level

First cluster observation - maps

Dual-band observation

- no SZ signal is expected at 260 GHz (for this noise level)
- Noise: 933 $\mu\text{Jy}/\text{beam}$
- 260 GHz map is used to identify point sources that may compensate SZ signal at 150 GHz

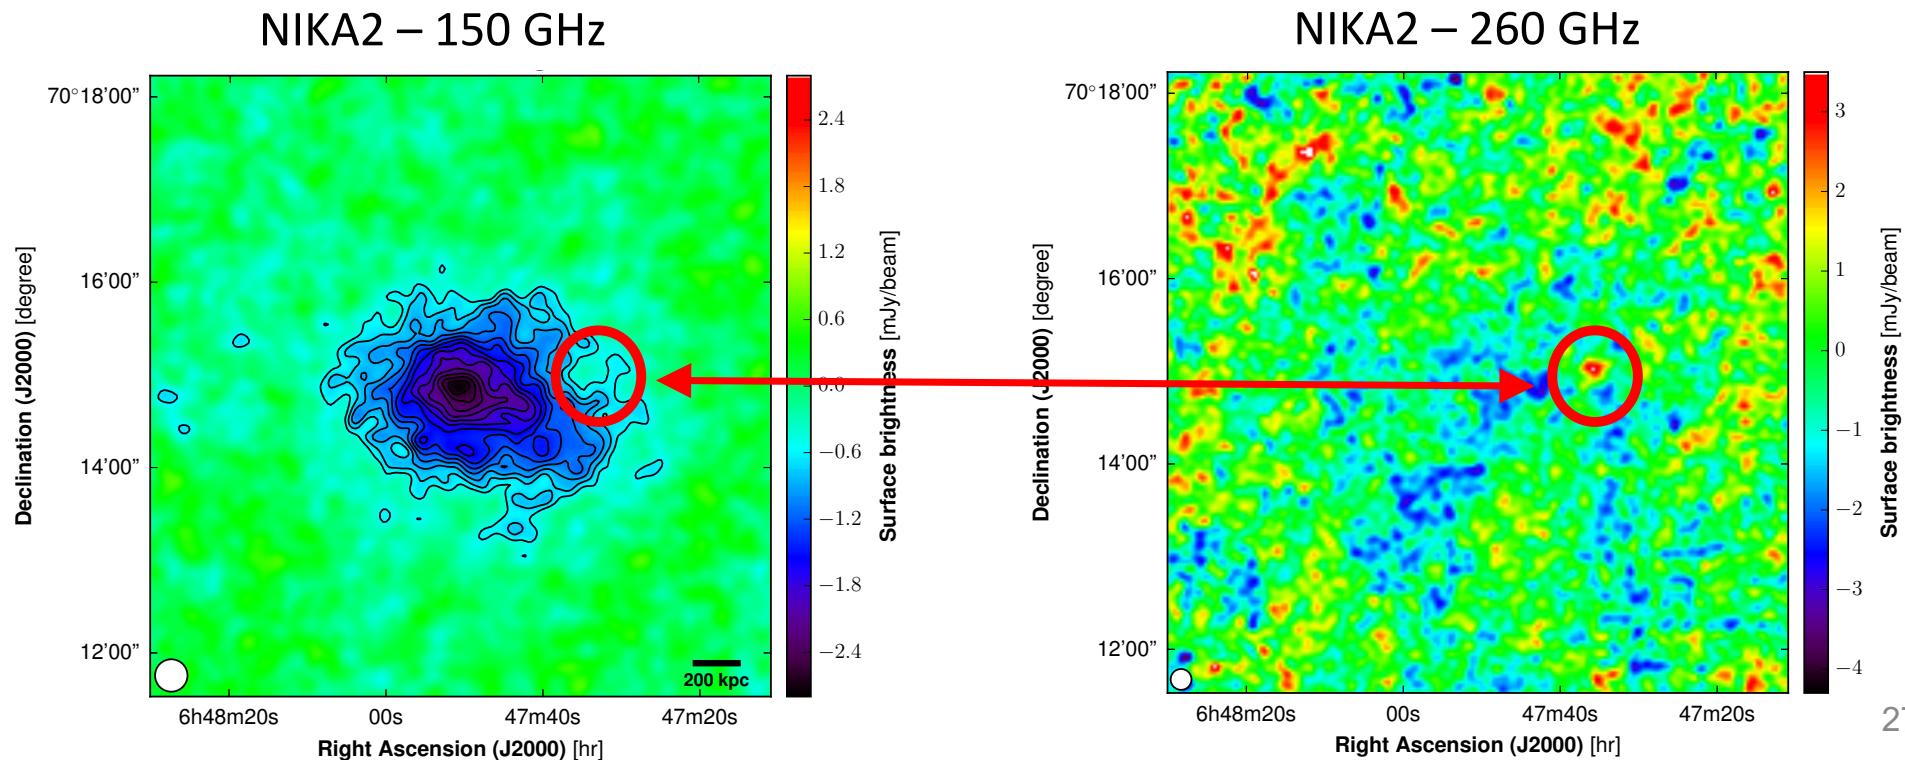

First cluster observation – point-source removal

F. Ruppin *et al.*, A&A 2018

Dual-band observation

- no SZ signal is expected at 260 GHz (for this noise level)
- Noise: $933 \mu\text{Jy}/\text{beam}$
- 260 GHz map is used to identify point sources that may compensate SZ signal at 150 GHz
- One source detected at 4σ , 1.3 arcmin from the center

First cluster observation – point-source removal

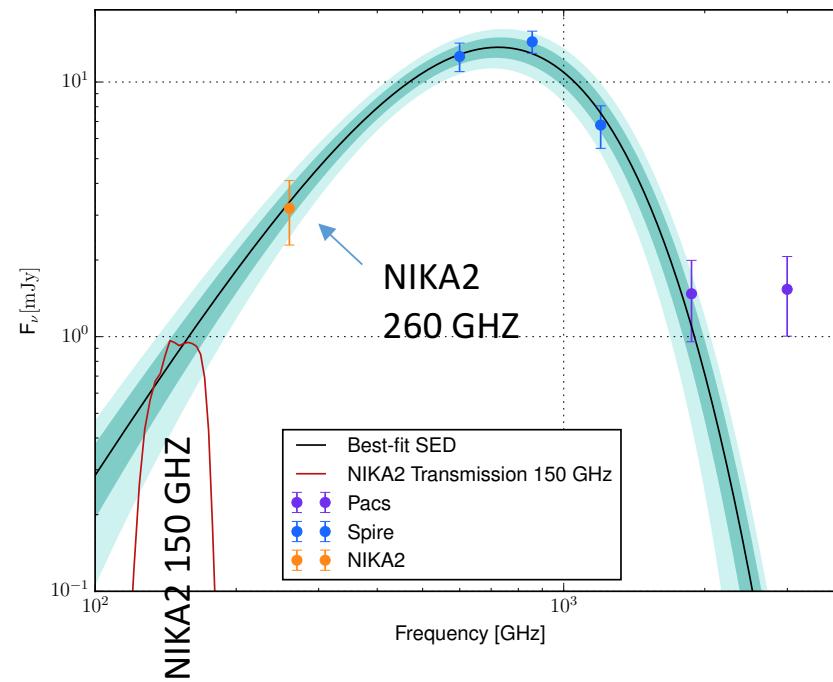

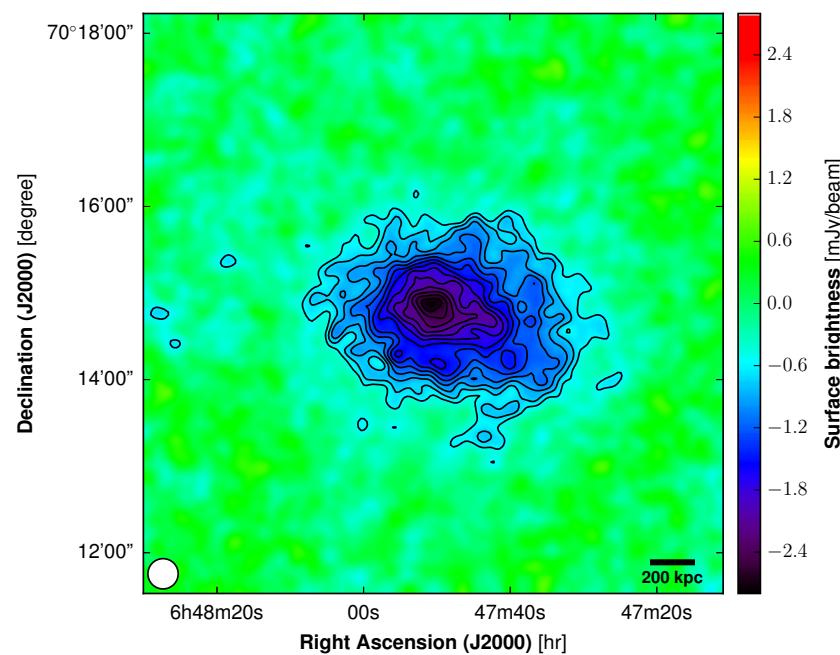

F. Ruppin *et al.*, A&A 2018

Point-source removal

Data: Herschel (0.1 to 0.5 mm) and NIKA2 data (260 GHz, 1 mm)

- fit of the Spectral Energy Distribution of the source
- estimation of the flux at 150 GHz (2mm)
- Corrected map at 150 GHz

NIKA2 – 150 GHz - corrected

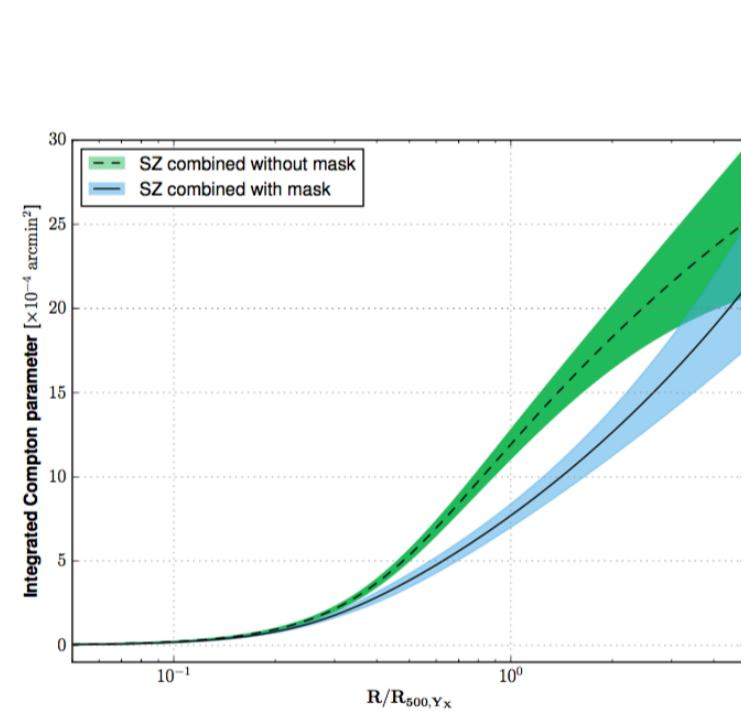

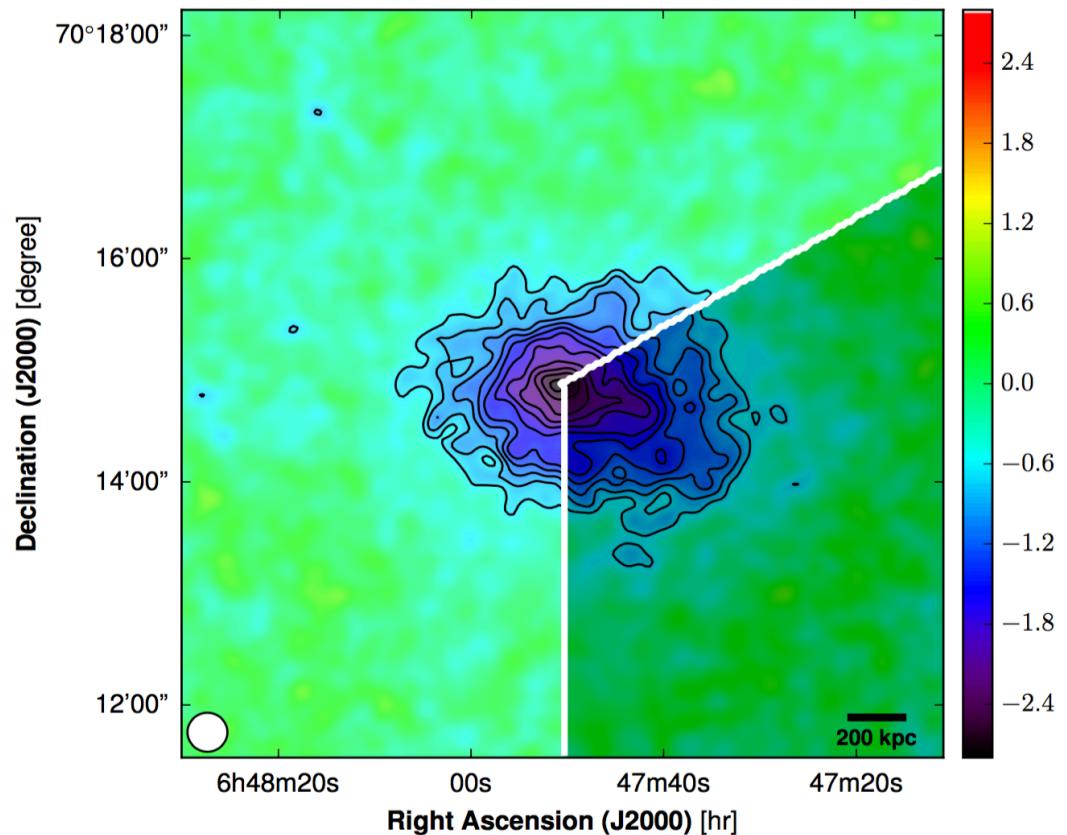

see talk by F. Kéruzoré, this session

First cluster observation – overpressure region

F. Ruppin *et al.*, A&A 2018

Discovery of an overpressure region

- should impact integrated SZ signal and mass
- highlight the need for high-resolution observations
this cluster is not resolved by Planck

First cluster observation – pressure profile

MCMC analysis based on a non-parametric model

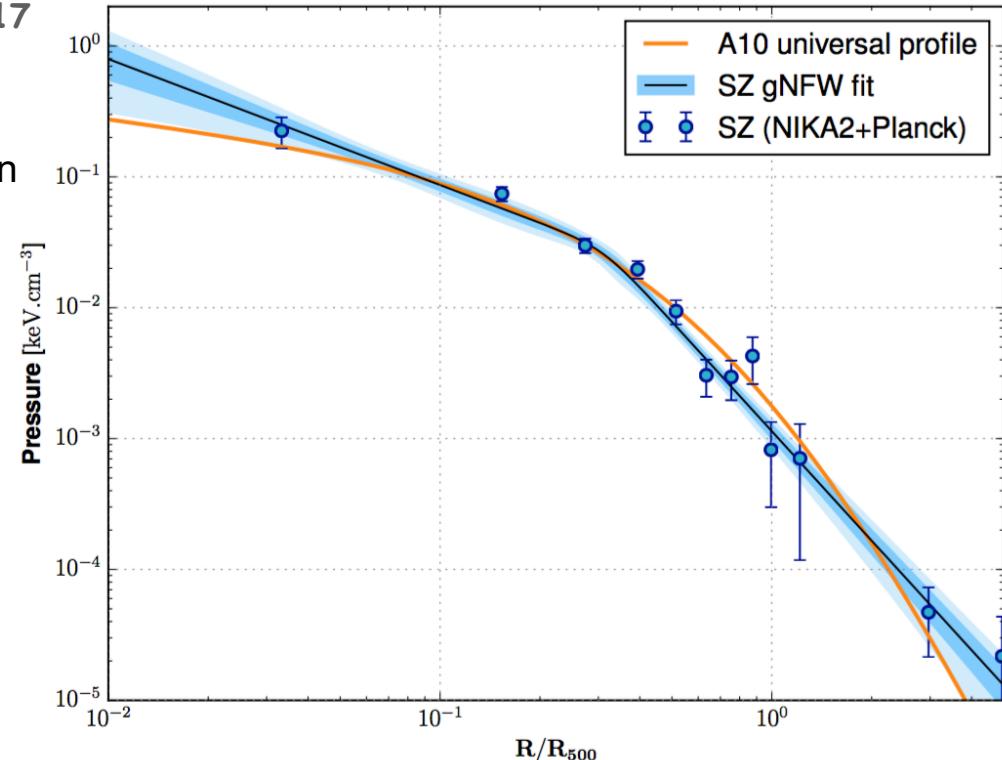

F. Ruppin *et al.*, A&A 2018

F. Ruppin *et al.*, A&A 2017

Data = NIKA2 and Planck

→ Deprojection of the electronic pressure distribution

→ Comparison with Universal Pressure Profile

- Small departure from the Universal Pressure Profile
→ no conclusion can be drawn from a single cluster
- NIKA2 Large program will allow us to
 - establish a Universal pressure profile at high z
 - study its redshift evolution

First cluster observation – thermodynamics

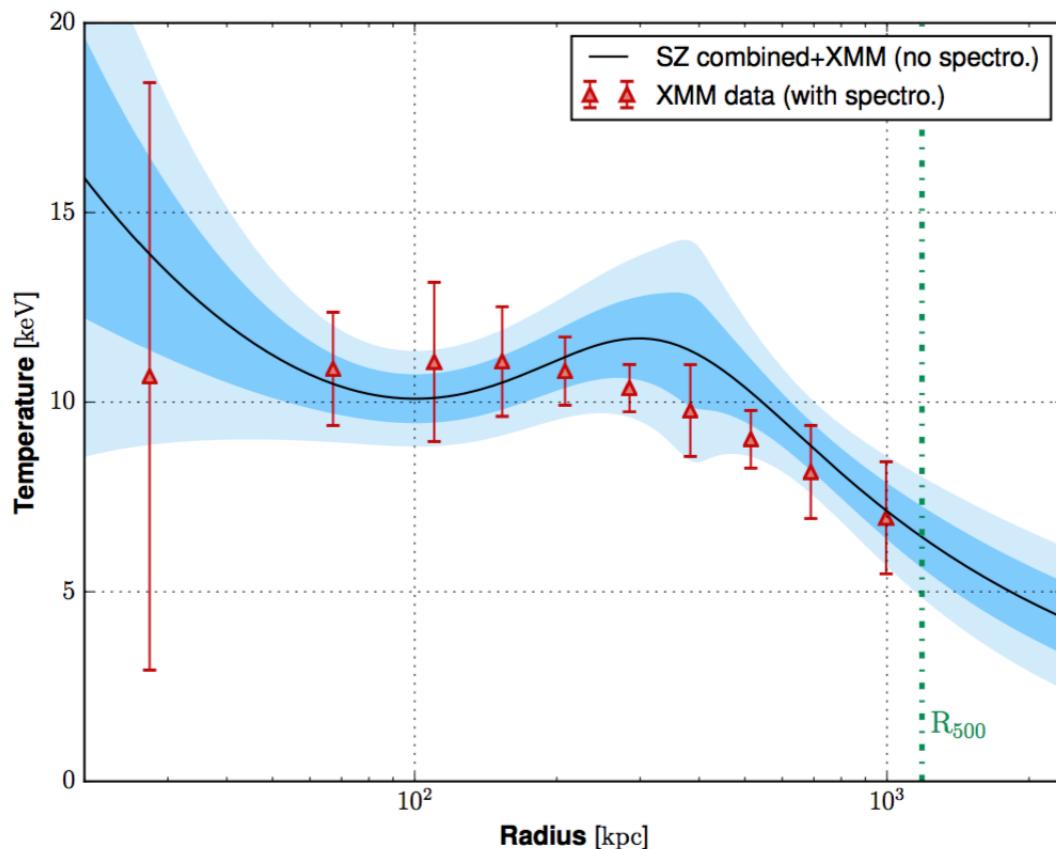

Combined analysis

Data = SZ and X-ray (XMM)

- A multi-probe study
- **Thermodynamic properties** of the cluster

Pressure, Temperature, Mass, Entropy profiles

F. Ruppin *et al.*, A&A 2018

Temperature profile

$$k_B T(r) = \frac{P(r)}{n(r)}$$

- Compatible with spectroscopy estimate
- ~11 keV in the cluster core
- disturbed cluster

First cluster observation – thermodynamics

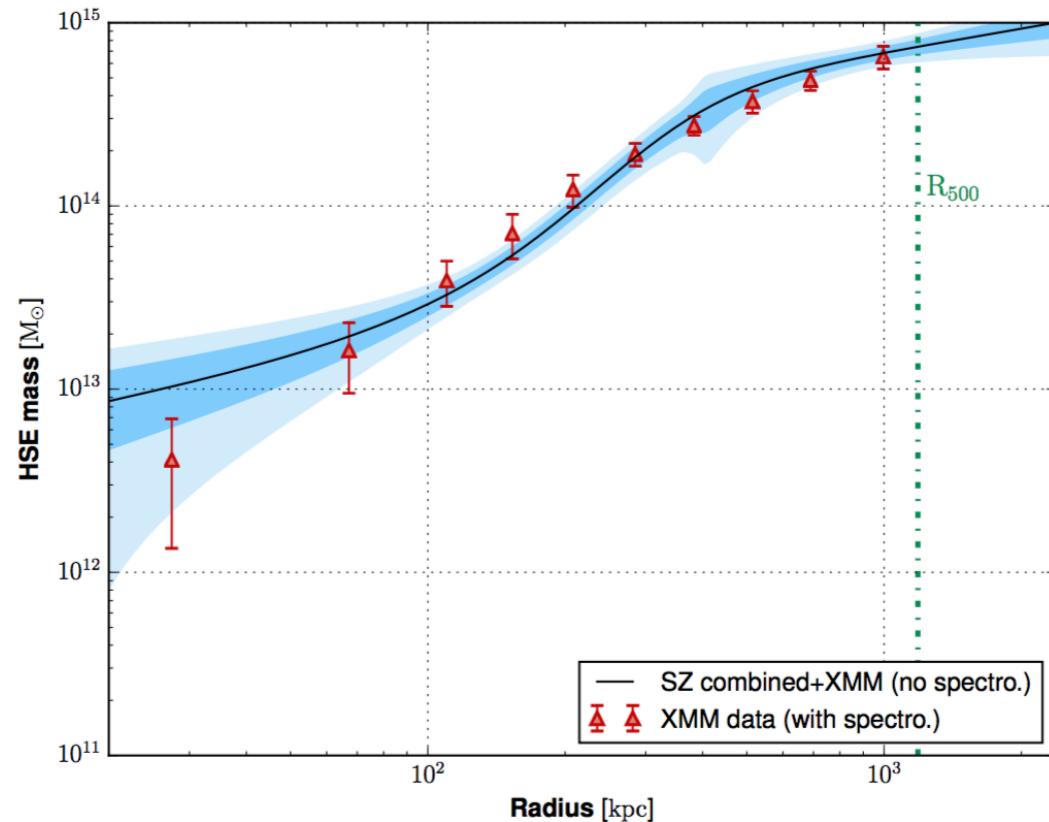

Combined analysis

Data = SZ and X-ray (XMM)

- A multi-probe study
- **Thermodynamic properties** of the cluster

Pressure, Temperature, Mass, Entropy profiles

Mass profile

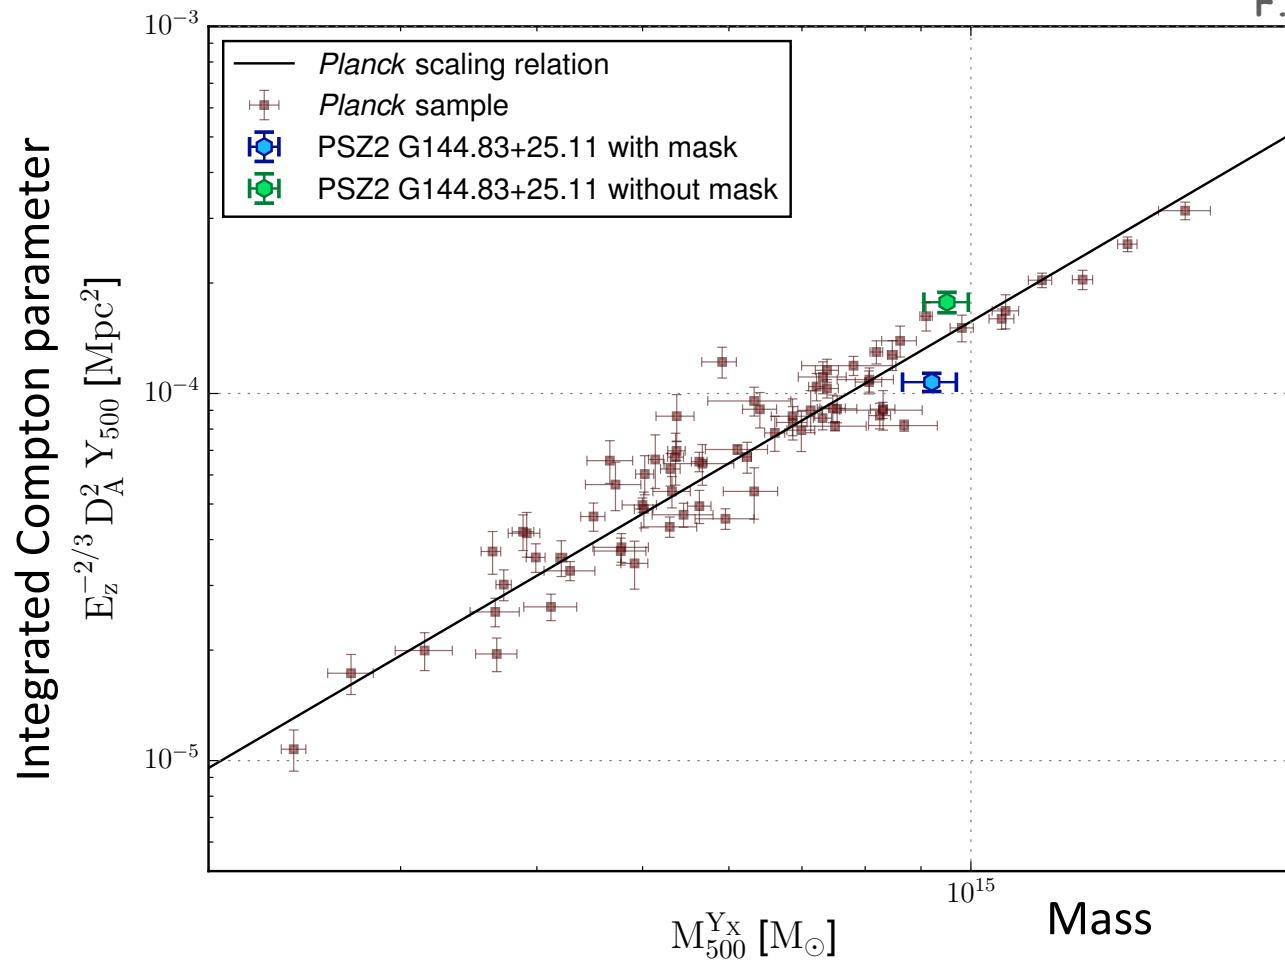

$$M(r) \propto \frac{1}{n(r)} \times \frac{dP}{dr}$$

Estimation of integrated quantities

- Cluster Mass
- Integrated Compton parameter

	With mask	Without mask
R_{500} [kpc]	1107 ± 30	1342 ± 61
Y_{500} [$\times 10^{-4}$ arcmin 2]	8.06 ± 0.46	13.31 ± 0.85
M_{500} [$\times 10^{14} M_{\odot}$]	6.95 ± 0.56	12.42 ± 1.43

First cluster observation – scaling relation

F. Ruppin *et al.*, A&A 2018

- First comparison of a NIKA2 cluster with the Planck scaling relation
- Highlight the impact of overpressure regions on integrated quantities (scatter)

→ very good result ... but relatively long observation time !

Conclusions

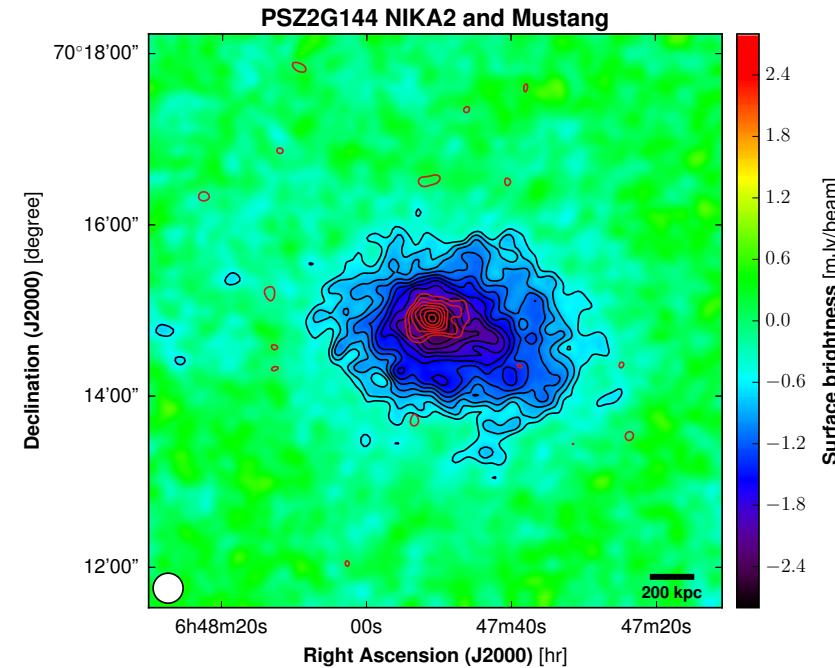

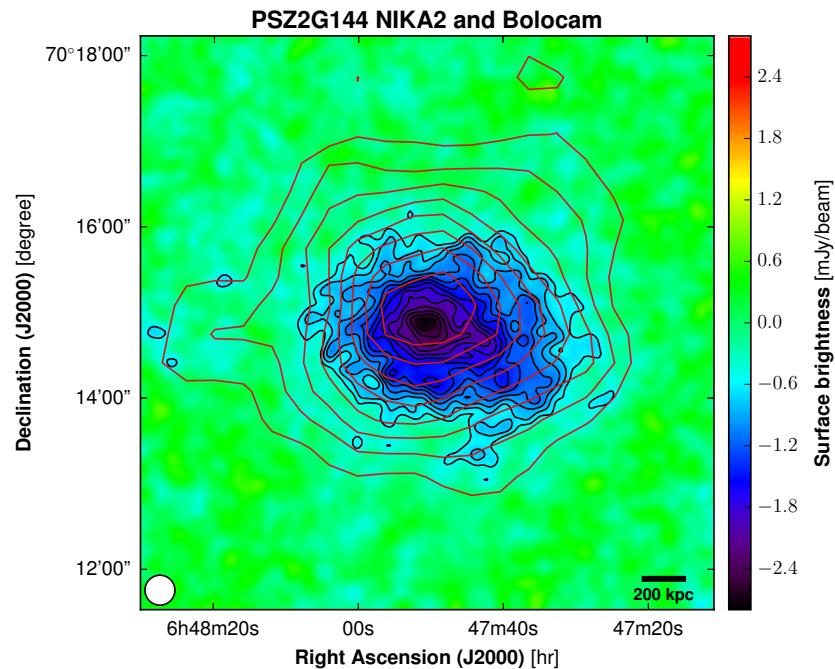

- High-resolution SZ observation of high-z clusters is a key issue for cluster cosmology.
- NIKA2 SZ Large Program: 45 clusters to be observed in the forthcoming years.
 - SZ (NIKA2) and X-ray (XMM-Newton) will have
 - impact on **cluster cosmology**
 - but also on **cluster physics**
- **First cluster observed with NIKA2**
 - Impact of high-resolution observations on cluster property estimates (mass)
 - First step toward a
 - NIKA2 mean pressure profile
 - NIKA2 scaling relation
 - see *talk by F. Kéruzoré (2nd cluster of the LPSZ)*

First cluster observation - comparison

Comparison with Bolocam and Mustang

F. Ruppin *et al.*, A&A 2018

Bolocam at 140 GHz
Angular resolution: 58''
FOV: 8'
 Caltech Submillimeter Observatory

NIKA2 at 150 GHz
Angular resolution: 18''
FOV: 6.5'
 IRAM 30-m Telescope

MUSTANG at 90 GHz
Angular resolution: 9''
FOV: 42''
 Green Bank Telescope

**With a large FOV and a high angular resolution,
 NIKA2 brings valuable information
 in the field of SZ imaging of clusters**

C. Romero *et al.*, A&A 2015
 S. R. Dicker *et al.*, Proc. SPIE 2008
 J. Glenn *et al.*, Proc. SPIE 1998
 F. Ruppin *et al.*, to be submitted (soon)

First cluster observation – thermodynamics

Combined analysis

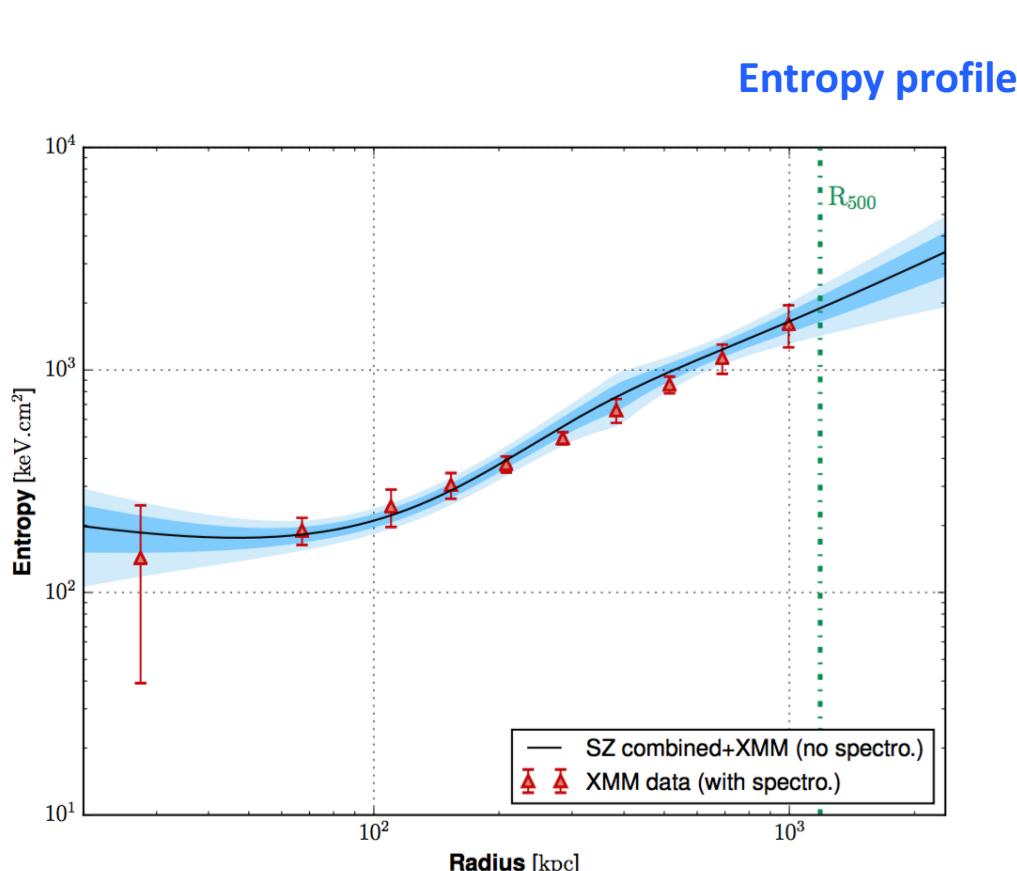

Data: Planck+NIKA+XMM

→ A multi-probe study

→ **Thermodynamic properties** of the cluster

Pressure, Temperature, Entropy, Mass profiles

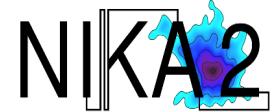

F. Ruppin *et al.*, A&A 2018

$$K(r) = \frac{P(r)}{n(r)^{5/3}}$$

Entropy is constant in the core
→ disturbed core

Cluster cosmology - methods

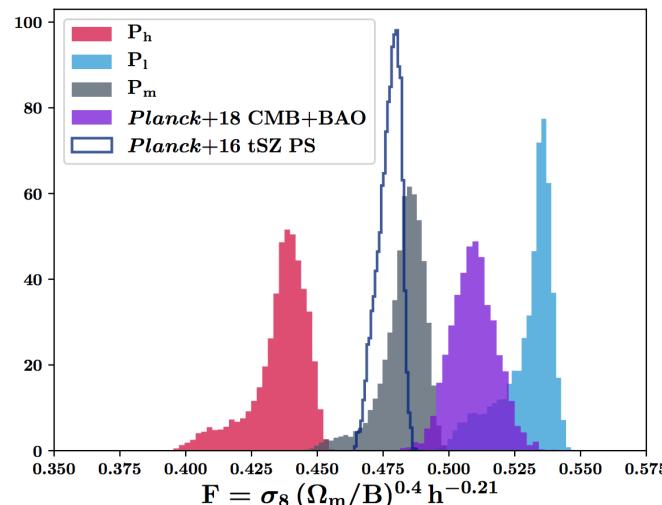

- **Methods**

- **Cluster count** $\frac{d^2n}{dMdz}$
- **SZ power spectrum** C_ℓ^{SZ}
- Very sensitive to cosmological parameters... but
High degeneracy between σ_8, Ω_m, h and B the hydrostatic bias

$$F = \frac{\sigma_8 \Omega_m^{0.40}}{B^{0.40} h^{0.21}} \quad \text{B. Bolliet \textit{et al.}, MNRAS 2018}$$

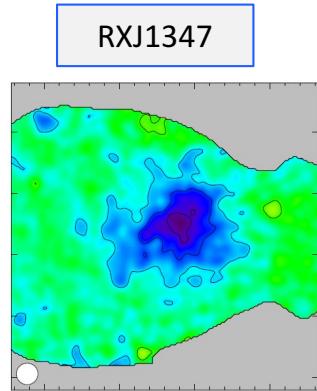

→ the only parameter that is directly constrained with clusters

F. Ruppin *et al.*, arXiv:1905.05129

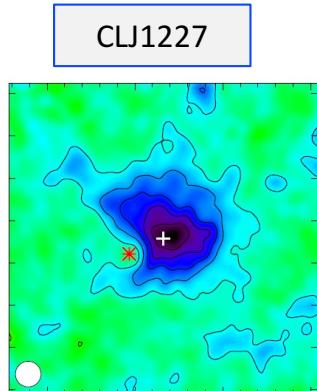

see talks by F. Ruppin & B. Bolliet,
Thursday morning
