Rencontres de Physique des Particules 2013  
LPSC Grenoble  
16/01/2013

# Proton-Proton collisions at the LHC

Our ability to **exploit the LHC potential** depends on the understanding of the **various processes** that take place in proton proton collisions

Hadronization: Modeling + Tunes to Data

Parton Showering and Matching: pQCD + Modeling

Hard-Scattering Matrix Elements: perturbative QCD (pQCD) + EW theory

Parton Distribution Functions: pQCD + Data + Methodology

Multiple Interactions, Pile-Up: Modeling

# QCD Factorization

- Deep-inelastic **lepton-proton scattering**: First evidence for **proton structure** (70s)
- QCD Factorization allows to separate the hadronic cross section into a **perturbative, process dependent partonic cross section** and **non-perturbative, process independent Parton Distributions**

$$F_i(x, Q^2) = x \sum_i \int_x^1 \frac{dz}{z} C_i \left( \frac{x}{z}, \alpha_s(Q^2) \right) f_i(z, Q^2).$$

**Partonic xsec**

**Parton Distribution**

- The same factorization allows to use the same **universal PDFs** to predict proton-proton collisions at the LHC:

$$\sigma_X(s, M_X^2) = \sum_{a,b} \int_{x_{\min}}^1 dx_1 dx_2 f_{a/h_1}(x_1, M_X^2) f_{b/h_2}(x_2, M_X^2) \hat{\sigma}_{ab \rightarrow X}(x_1 x_2 s, M_X^2)$$

**x-Bjorken**: momentum fraction carried by **parton q**  
**Q<sup>2</sup>** = **Resolution scale** at which proton is being probed

**Parton Distributions**

**Partonic xsec**

# Parton Distributions

- One independent PDF for each parton in the proton:  $u(x, Q^2)$ ,  $d(x, Q^2)$ ,  $g(x, Q^2)$ , ... 13 PDFs
- At Leading Order PDFs understood as the **probability of finding a parton of a given flavor that carries a fraction  $x$  of the total proton's momentum**
- The dependence of PDFs on **Bjorken- $x$**  is **non perturbative**, but the scale (resolution) dependence is dictated by the integro-differential **DGLAP evolution equations**

$$\frac{\partial q_i(x, Q^2)}{\partial \ln Q^2} = \frac{\alpha_s(Q^2)}{2\pi} \int_x^1 \frac{dz}{z} P_{ij}(z, \alpha_s(Q^2)) q_j\left(\frac{x}{z}, Q^2\right)$$

- $x$ -dependence  $q(x, Q_0^2)$  extracted from data, pQCD determines PDFs at other scales  $q(x, Q^2)$ . **Evolution kernels** have been computed up to NNLO

$$P(z, \alpha_s(Q^2)) = P^{(0)}(z) + \frac{\alpha_s(Q^2)}{2\pi} P^{(1)}(z) + \left(\frac{\alpha_s(Q^2)}{2\pi}\right)^2 P^{(2)}(z)$$

- Additional **theoretical constraints** from total momentum and valence **sum rules**

$$\int_0^1 dx \, x [\Sigma(x) + g(x)] = 1$$

$$\int_0^1 dx \, (u(x) - \bar{u}(x)) = 2, \quad \int_0^1 dx \, (d(x) - \bar{d}(x)) = 1$$

# Parton Distributions at the LHC

**Parton Distributions**, and their theoretical and experimental uncertainties play a crucial role for hadron collider phenomenology:

The study of the Higgs boson properties is a cornerstone of the LHC program. **All production cross sections** require accurate knowledge of **different PDF combinations**

**gg fusion, ttH:** gluon luminosity

**vector-boson fusion:** quark-quark luminosity

**associated production with W/Z:** quark-antiquark luminosity

**PDF uncertainties** severely limit the accuracy with which **Higgs couplings** can be extracted from the measured cross sections

The *Higgs Cross Section Working Group* prescription, used in the ATLAS and CMS analysis, adopts the **envelope of NNPDF2.1, CT10 and MSTW08** sets to **estimate PDF uncertainty**

# Parton Distributions at the LHC

Parton Distributions, and their theoretical and experimental uncertainties play a crucial role for hadron collider phenomenology:

**New CDF Result (2.2 fb<sup>-1</sup>)**  
**Transverse Mass Fit Uncertainties**

	<i>electrons</i>	<i>muons</i>
W statistics	19	16
Lepton energy scale	10	7
Lepton resolution	4	1
Recoil energy scale	5	5
Recoil energy resolution	7	7
Selection bias	0	0
Lepton removal	3	2
Backgrounds	4	3
pT(W) model	3	3
Parton dist. Functions	10	10
QED rad. Corrections	4	4
Total systematic	18	16

PDFs are dominant systematic in the very precise measurement of **W mass** @ **Tevatron**, even more at **LHC**, which **indirectly constraints the Higgs mass**

This is also the case for many other Electroweak measurements at the LHC, like the determination of the **effective lepton mixing angle** from the **Forward-Backward asymmetry** (with an accuracy comparable to LEP).

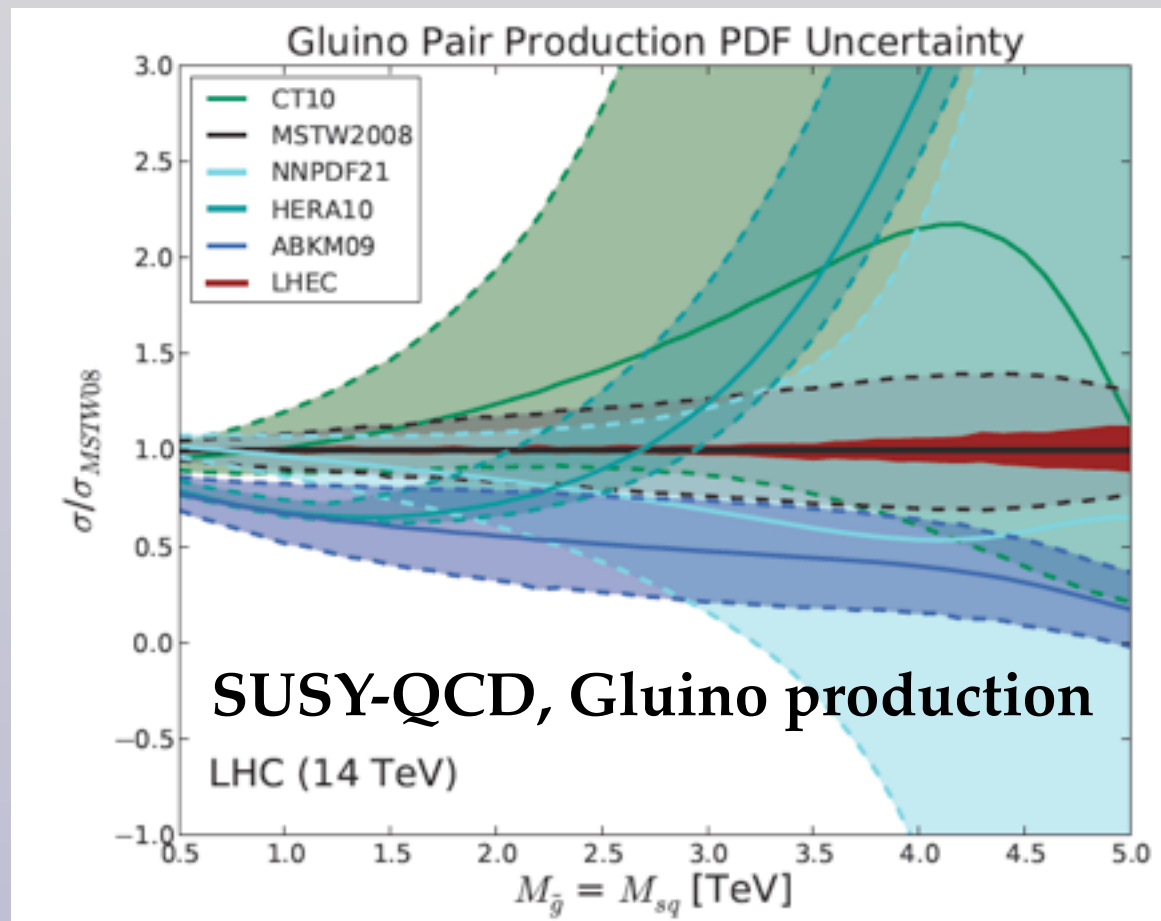

We need **improved PDFs** to decrease these systematic uncertainties: **LHC data** will be instrumental to achieve this goal

LPSC, Grenoble, 16/01/2012

# Parton Distributions at the LHC

Parton Distributions, and their theoretical and experimental uncertainties play a crucial role for hadron collider phenomenology:

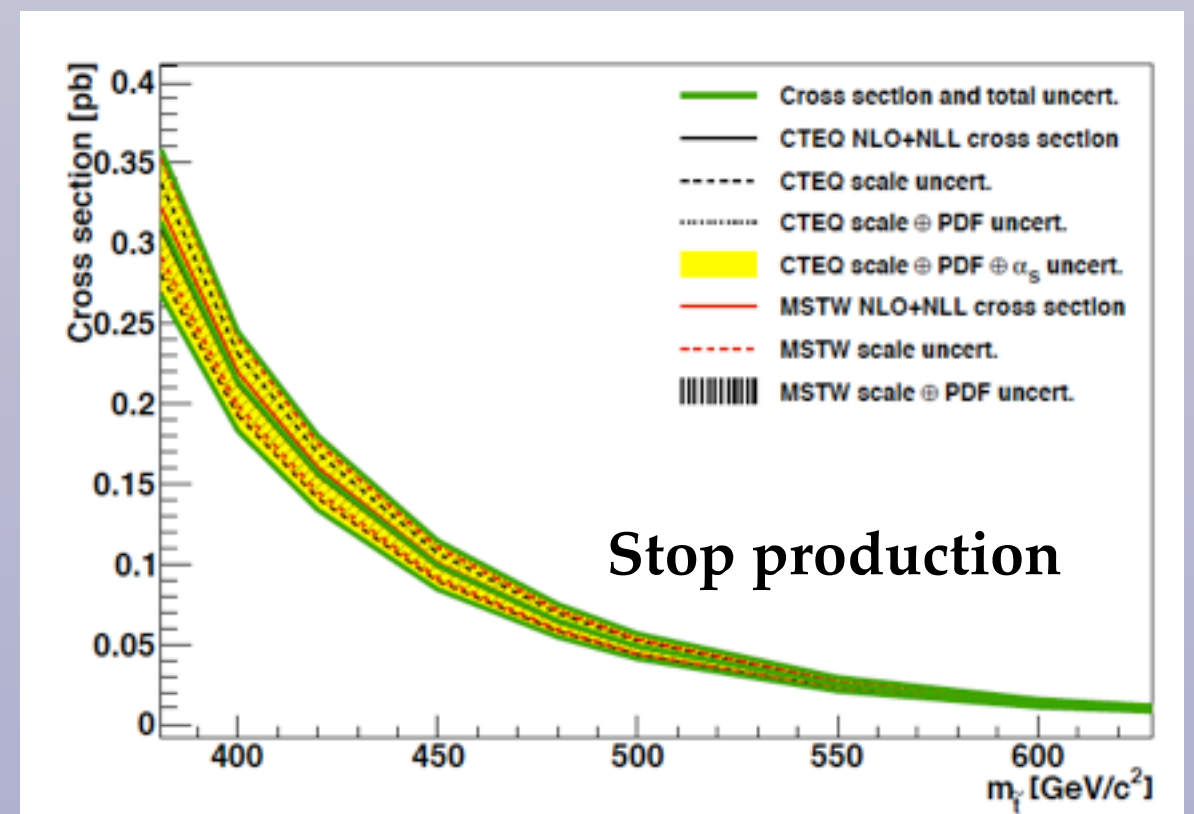

• LHC data will help to pin down poorly known PDFs in the next years: high- $p_T$  jets, high mass  $W, Z$  production, top quark production

• Also **electroweak corrections** are crucial at high energies (similar size as QCD): need PDFs with **photon and electroweak effects** to probe in detail the TeV scale

• PDF uncertainties are the largest theory uncertainties for the predictions of **high mass BSM particles**: SUSY,  $Z'$ , extra dimensions

• PDF errors larger than 100% for  $M > 2$  TeV: if new heavy particles are found, it would be **impossible to examine their properties** (couplings, branching fractions) unless **better large- $x$  PDFs** are obtained

# Parton Distributions at the LHC

PDF sets differ by choice of dataset, QCD treatment, methodology, ....

	DATASET	PERT. ORDER	HQ TREATMENT	$\alpha_s$	PARAM.	UNCERT.
ABM11	DIS Drell-Yan	NLO NNLO	FFN (BMSN)	Fit (multiple values available)	6 indep. PDFs Polynomial (25 param.)	Hessian ( $\Delta\chi^2=1$ )
CT10	Global	LO NLO NNLO	GM-VFNS (S-ACOT)	External (multiple values available)	6 indep. PDFs Polynomial (26 param.)	Hessian ( $\Delta\chi^2=100$ )
JR09	DIS Drell-Yan Jets	NLO NNLO	FFN VFN	Fit	5 indep. PDFs Polynomial (15 param.)	Hessian ( $\Delta\chi^2=1$ )

NNPDF2.1/2.3	Global	LO NLO NNLO	GM-VFNS (FONLL)	External (multiple values available)	7 indep. PDFs Neural Nets (259 param.)	Monte Carlo

# Artificial Neural Networks

- Artificial Neural Networks (ANNs) provide **universal unbiased interpolants** to parametrize PDFs at low input scales

$$\begin{aligned}\Sigma(x, Q_0^2) &= (1-x)^{m_\Sigma} x^{-n_\Sigma} \text{NN}_\Sigma(x) \\ g(x, Q_0^2) &= A_g (1-x)^{m_\Sigma} x^{-n_\Sigma} \text{NN}_g(x)\end{aligned}$$

- The ANN class that we adopt are **feed-forward multilayer neural networks** (perceptrons)

$$\xi_i^{(l)} = g \left( h_i^{(l)} \right) , \quad i = 1, \dots, n_l , \quad l = 2, \dots, L$$

$$h_i^{(l)} = \sum_{j=1}^{n_{l-1}} \omega_{ij}^{(l)} \xi_j^{(l-1)} - \theta_i$$

- In traditional PDF determinations, the input *ansatz* is a simple **polynomial**

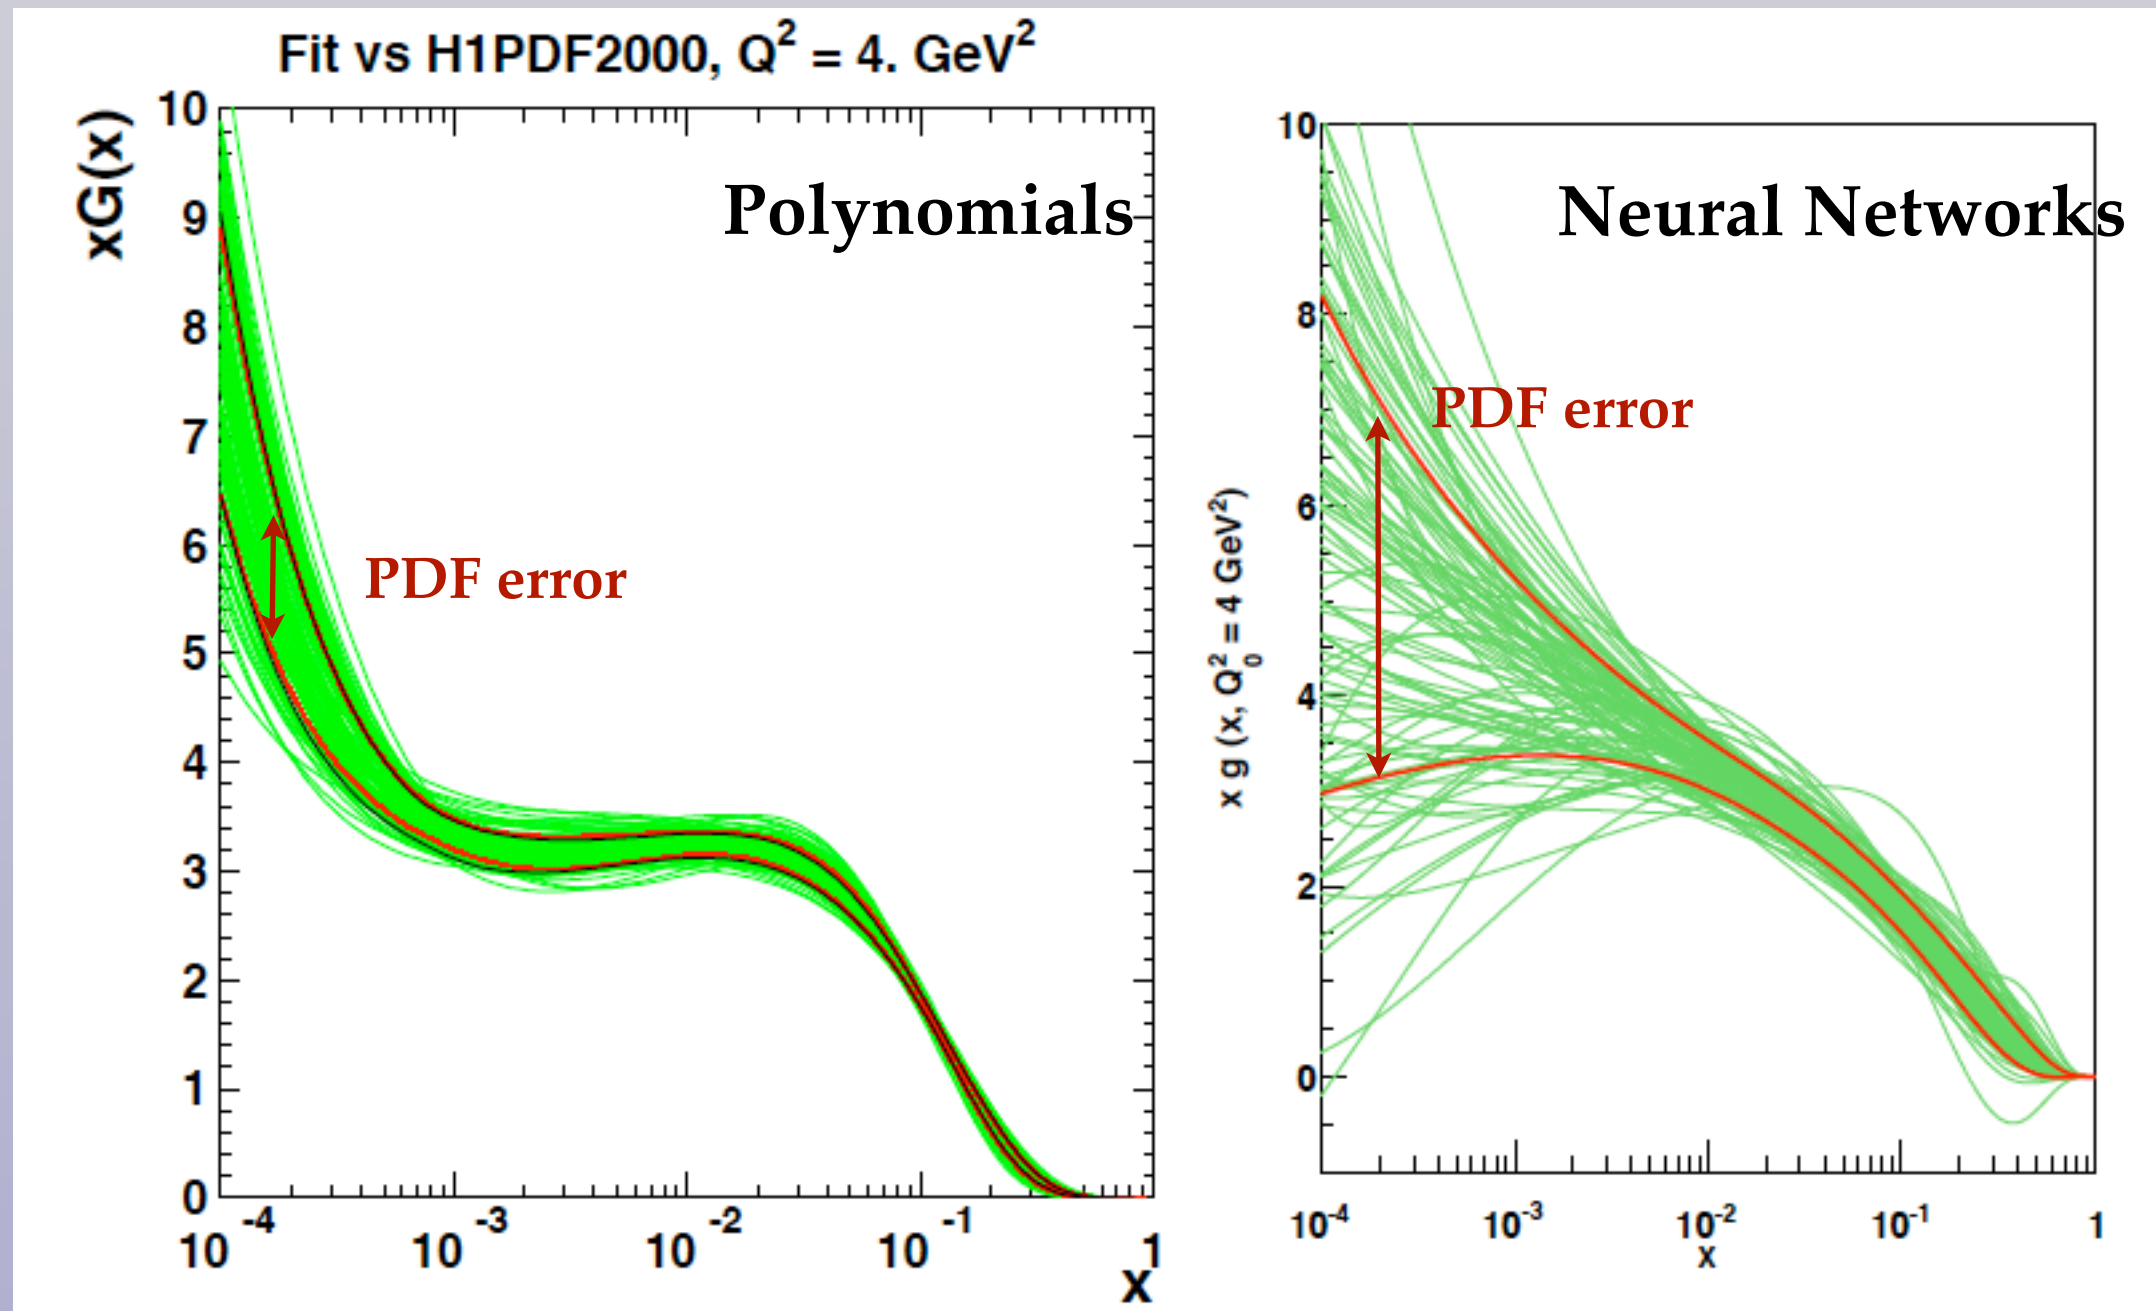

$$\begin{aligned}\Sigma(x, Q_0^2) &= (1-x)^{m_\Sigma} x^{-n_\Sigma} (1 + a_\Sigma \sqrt{x} + b_\Sigma x + \dots) , \\ g(x, Q_0^2) &= A_g (1-x)^{m_\Sigma} x^{-n_\Sigma} (1 + a_g \sqrt{x} + b_g x + \dots)\end{aligned}$$

- The use of Neural Networks allows:

- No theory bias** introduced in the PDF determination by the choice of *ad-hoc* functional forms
- The use of very flexible parametrizations for all PDFs - regardless of the dataset used. The NNPDF analysis allow for **O(400) free parameters**, to be compared with **O(10-20) in traditional PDFs**
- Faithful extrapolation:** PDF uncertainties **blow up** in regions with scarce experimental data

# Artificial Neural Networks vs. Polynomials

- Compare a benchmark PDF analysis (HERALHC workshop) where the same dataset is fitted with **Artificial Neural Networks** and with **standard polynomials** (everything else identical)
- ANN avoid biasing the PDFs, **faithful extrapolation at small-x** (very few data, thus error blow up)

# LHC data and PDF analysis

NNPDF2.3 dataset

LHC data already part of global PDF analysis,  
*ie.* the recent NNPDF2.3 sets

The inclusive jet data constrains large- $x$  gluon

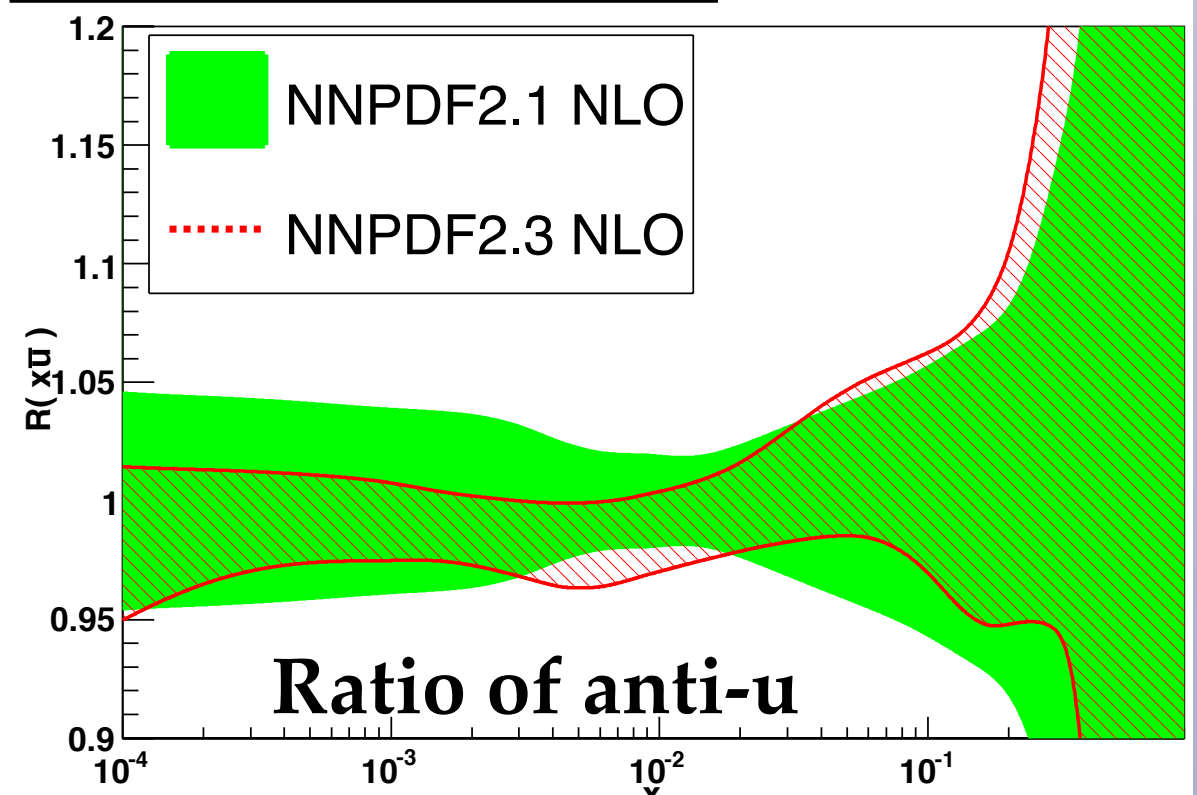

The W and Z production data from CMS,  
ATLAS and LHCb constrain medium- $x$   
antiquarks

Ratio to NNPDF2.1,  $Q^2 = 10^4 \text{ GeV}^2$

Ratio of gluons

Ratio to NNPDF2.1,  $Q^2 = 10^4 \text{ GeV}^2$

Ratio of anti-u

# Determination of Standard Model parameters

- 📍 Accurate PDFs are required for **precision determination** of fundamental Standard Model parameters in processes involving initial state hadrons
- 📍 The **strong coupling constant  $\alpha_s$**  can be determined from a global PDF analysis, mostly from scaling violations in Deep-Inelastic Scattering and in inclusive jet production
- 📍 CMS has recently determined  $\alpha_s$  from the ratio of 3-jet to 2-jet cross sections at the LHC, providing the determination of the strong coupling at the highest scales ever probed, using **NNPDF2.1** as input

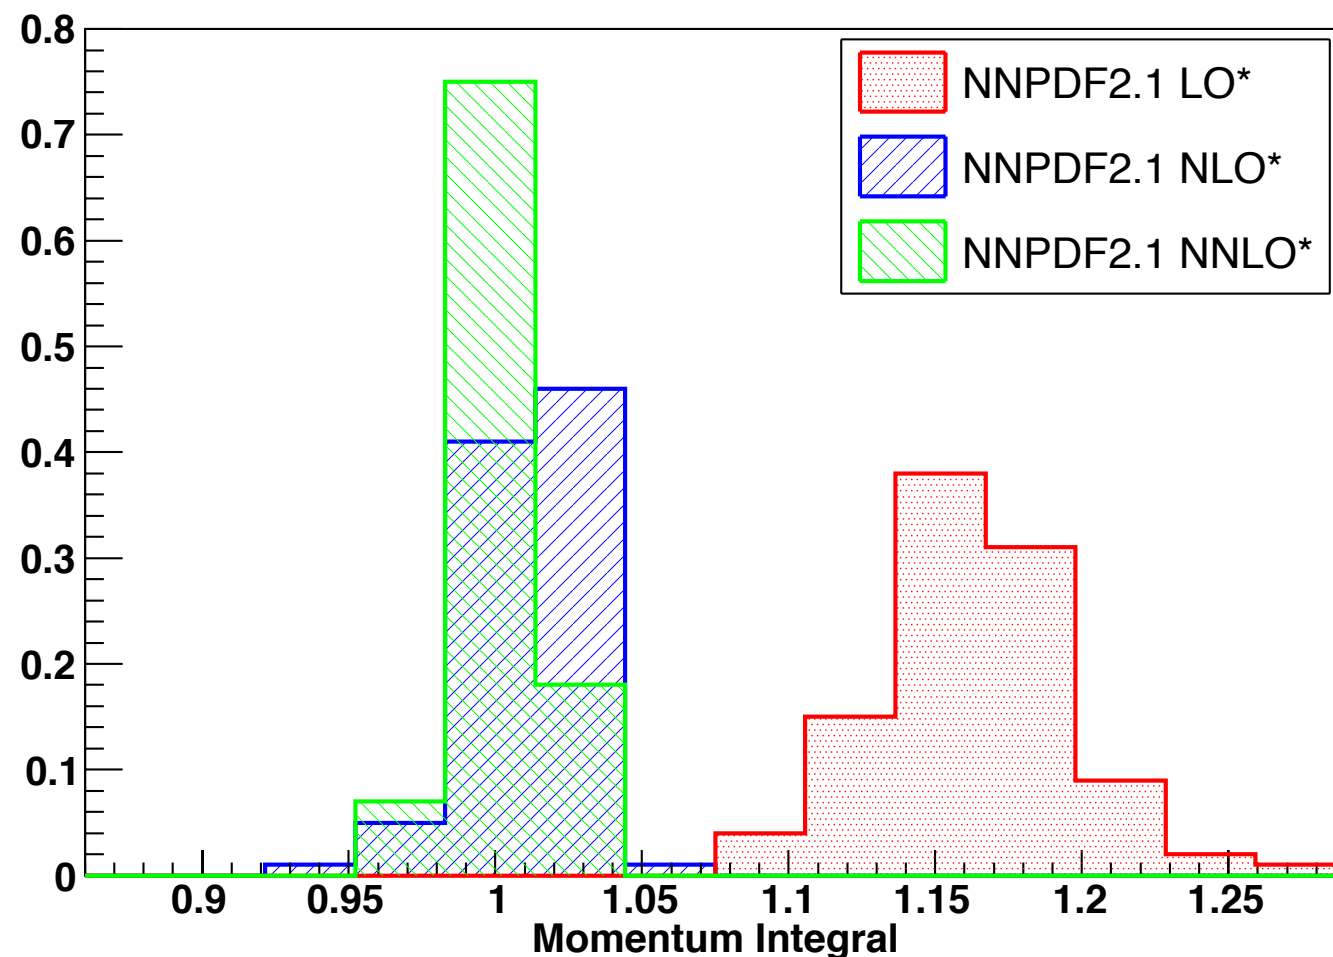

# Precision tests of the Factorization Theorem

📌 Perturbative QCD requires that the **momentum integral** should be unity to all orders

$$[M](Q^2) \equiv \int_0^1 dx \left( xg(x, Q^2) + x\Sigma(x, Q^2) \right)$$

📌 Is it possible to **determine** the value of the momentum integral from the global PDF analysis, rather than **imposing** it? Check in LO\*, NLO\* and NNLO\* fits **without setting M=1**

$$\begin{aligned} [M]_{\text{LO}} &= 1.161 \pm 0.032, \\ [M]_{\text{NLO}} &= 1.011 \pm 0.018, \\ [M]_{\text{NNLO}} &= 1.002 \pm 0.014. \end{aligned}$$

📌 Experimental data beautifully **confirms the pQCD expectation**

📌 **Extremely non trivial test** of the global analysis framework and the **factorization hypotheses**

📌 Very good convergence of the QCD perturbative expansion

# Cross section Ratios between 7, 8 and 14 TeV

- The staged increase of the LHC beam energy provides a new class of interesting observables: **cross section ratios** for different beam energies

$$R_{E_2/E_1}(X) \equiv \frac{\sigma(X, E_2)}{\sigma(X, E_1)} \quad R_{E_2/E_1}(X, Y) \equiv \frac{\sigma(X, E_2)/\sigma(Y, E_2)}{\sigma(X, E_1)/\sigma(Y, E_1)}$$

- These ratios can be computed with **very high precision** due to the large degree of **correlation of theoretical uncertainties** at different energies
- **Experimentally** these ratios can also be measured accurately since many systematics, like luminosity or jet energy scale, **cancel partially in the ratios**
- These ratios allow **stringent precision tests of the SM**, like **PDF discrimination**

# Cross section Ratios between 7, 8 and 14 TeV

- If SM theory systematics under control, cross section ratios can show an improved sensitivity to New Physics than absolute cross sections

$$\sigma(pp \rightarrow X) = \sigma^{SM}(pp \rightarrow X) + \sigma^{BSM}(pp \rightarrow X)$$

- The **visibility of a BSM contribution** in the **evolution with energy** of the cross section requires that it evolves **differently from the SM contribution**

$$R_{E_1/E_2}^X \sim \frac{\sigma_X^{SM}(E_1)}{\sigma_X^{SM}(E_2)} \times \left\{ 1 + \frac{\sigma_X^{BSM}(E_1)}{\sigma_X^{SM}(E_1)} \Delta_{E_1/E_2} \left[ \frac{\sigma_X^{BSM}}{\sigma_X^{SM}} \right] \right\}$$

$$\Delta_{E_1/E_2}(A) = 1 - \frac{A(E_2)}{A(E_1)}$$

Example: a **gluon-gluon initiated BSM** contribution to **high-mass Z production**.

The cross section ratio enhanced by:

$$\frac{\sigma_Z^{BSM}(m_X)}{\sigma_Z^{SM}(m_X)} \Delta_{E_1/E_2} \left[ \frac{\mathcal{L}_{gg}(m_X)}{\mathcal{L}_{q\bar{q}}(m_X)} \right]$$

With greatly reduced experimental and theoretical uncertainties

But **theory systematics, mostly PDFs**, need to be known accurately for this new approach to show its **full potential**

# PDF prospects at the LHC

📌 From the **experimental data point of view**, all the **current and future needs of the LHC in terms of PDFs** can be addressed by a **specific PDF program at the LHC**, without the need of new facilities

📌 There is a long list of measurements to be pursued, that will provide all required information on PDFs:

📌 Inclusive jets and dijets, central and forward: **large-x quarks and gluons**

📌 Isolated photons: **medium-x gluons**

📌 Inclusive W and Z production and asymmetries: **quark flavor separation, strangeness**

📌 W production with charm quarks: **direct handle on strangeness**

📌 W production with jets: **medium small-x gluon**

📌 Off resonance DY and W production at small and high mass: **quarks at very small and very large-x**

📌 Top quark distributions: **large-x gluon**

📌 Z+charm: **intrinsic charm PDF**

📌 Single top production: **gluon and bottom PDFs**

📌 Charmonium production: **small-x gluon**

📌 Some of these have/are being already carried out, and LHC data is already being used in PDF fits like **NNPDF2.3**. Constraints are expected to be larger with the **full 8 TeV dataset** and with **13/14 TeV data**

📌 To maximize the **LHC data impact on PDFs**, it is crucial to **coordinate a detailed PDF program** between the LHC experiments and the Theory community

# Summary

- 📌 **Parton Distributions** are an essential ingredient for LHC phenomenology
- 📌 Accurate PDFs are required for **precision SM measurements, Higgs characterization** and many **New Physics searches**
- 📌 The determination of **fundamental SM parameters** like the **W mass** or  $\alpha_s$  from **LHC data** also greatly benefit from improved PDFs
- 📌 **BSM physics** seems to be **elusive at the LHC**: **precision QCD** will be mandatory for searches in the next years
- 📌 The NNPDF approach provides parton distributions based on a **robust, unbiased methodology**, the most updated **theoretical information** and all the relevant hard scattering data **including LHC data**
- 📌 Near future developments in NNPDF:
  - 📌 **Inclusion of more LHC data**: 7 and 8 TeV W, Z, dijets, top distributions, photons, W +charm, W,Z+jets, high mass off resonance W, ...
  - 📌 Inclusion of the **complete HERA-II** inclusive and charm dataset
  - 📌 PDFs for **NLO Monte Carlo event generators** at the LHC
  - 📌 PDFs with **QED** and electroweak effects, and PDFs with **Intrinsic Charm**

# Extra Material

# Determination of Standard Model parameters

- 🔧 **Accurate PDFs** are required for **precision determination** of fundamental **Standard Model** parameters in processes involving initial state hadrons
- 🔧 These include, among many others, the **strong coupling constant  $\alpha_s$** , the **W boson mass**, the effective **lepton mixing angle**, **CKM** matrix elements, ....
- 🔧 The **unbiased** nature of the NNPDF approach approach to **faithfully disentangle** PDF uncertainties from other parametric uncertainties. One example in neutrino DIS:

CKM matrix element  $V_{cs}$  can be determined from **neutrino DIS data** - but large uncertainties from **strange PDF**

NNPDF analysis manages to obtain the **most accurate ever determination** of  $V_{cs}$  from a single process:

$$V_{cs} = 1.04 \pm 0.06 \text{ (PDG average)}$$

**$V_{cs} = 0.96 \pm 0.07$  (NNPDF from NuTeV data)**

The same analysis shows that the **strangeness asymmetry** in the proton has just the right size to **cancel the NuteV anomaly**

$$R_{\text{PW}} \equiv \frac{\sigma(\nu\mathcal{N} \rightarrow \nu X) - \sigma(\bar{\nu}\mathcal{N} \rightarrow \bar{\nu} X)}{\sigma(\nu\mathcal{N} \rightarrow \ell X) - \sigma(\bar{\nu}\mathcal{N} \rightarrow \bar{\ell} X)}$$

$$= \frac{1}{2} - \sin^2 \theta_W + \left[ \frac{([U^-] - [D^-]) + ([C^-] - [S^-])}{[Q^-]} \frac{1}{6} (3 - 7 \sin^2 \theta_W) \right]$$

# Genetic Algorithms: Example

Maximisation of  $f(x) = x^2$  on the interval  $x \in [0, 31]$

1. **Encode** our problem parameter  $x$  into a string, the *chromosome*, on which the GA can then operate. Possibility: binary encoding,  $x = 1$  codes as 00001 and  $x = 31$  as 11111.
2. Create at random the initial population with fixed number of individuals  $i = 1, \dots, N$ . We take  $N = 4$  for illustration. Fitness calculated with the function to maximise:  $f(x) = x^2$

$i$	Genotype	Phenotype $x_i$	Fitness $f_i = f(x_i)$	$f_i / \sum f_i$
1	01101	13	169	0.14
2	11000	24	576	0.49
3	01000	8	64	0.06
4	10011	19	361	0.31

The first child generation after selection and crossover:

$i$	Genotype	Phenotype $x_i$	Fitness $f_i = f(x_i)$	$f_i / \sum f_i$
5	01100	12	144	0.08
6	11001	25	625	0.36
7	11011	27	729	0.42
8	10000	16	256	0.14

The rapid increase of fitness over the very first few generations is a common feature of GAs.

# Beyond unpolarized PDFs

• The **NNPDF methodology** can be applied to many other closely related problems

• **Polarized** parton distributions: The **spin content of the proton**

• **Nuclear** parton distributions: Initial Conditions for **Quark-Gluon Plasma studies** at the LHC

• **Hadron fragmentation** functions

• Transverse momentum dependent PDFs, Generalized PDFs, ....

• NNPDF is already working on **polarized PDFs** and **nuclear PDFs**. Other groups use **NNPDF-like technology** in their QCD analysis

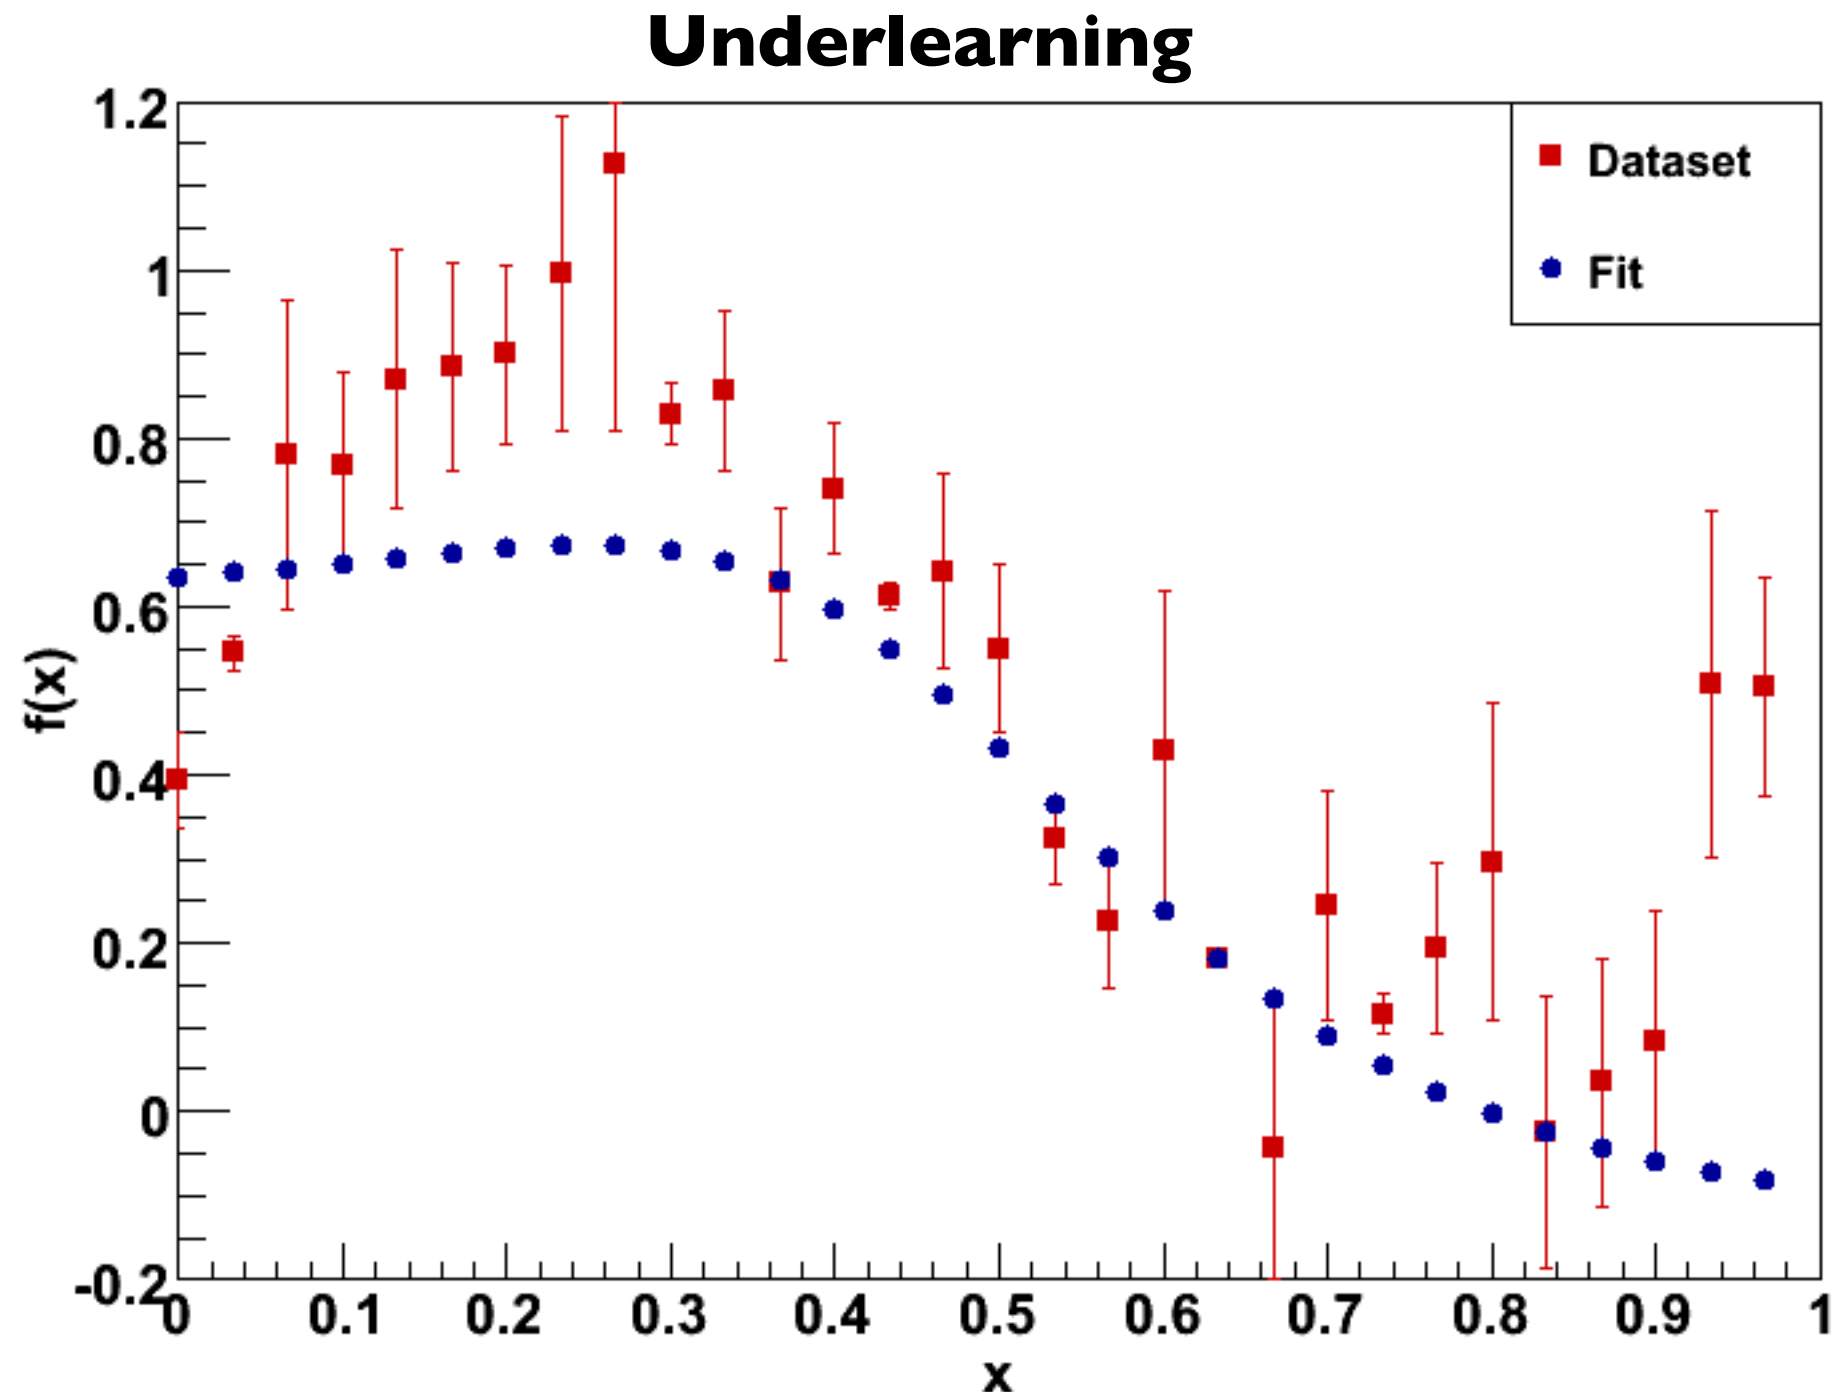

NNPDFpol1.0: unbiased determination of the spin content of the proton  
Substantial error underestimation in the standard polarized approach

N3PDFs: unbiased determination of nuclear PDFs from Proton-Lead  
LHC data: crucial input for QGP characterization

# Filtering Noise: Cross-Validation Stopping

With a flexible PDF parametrization as ANNs one can reach the point of fitting the statistical fluctuations on the data - on top of the underlying physical law

# Filtering Noise: Cross-Validation Stopping

With a flexible PDF parametrization as ANNs one can reach the point of fitting the statistical fluctuations on the data - on top of the underlying physical law

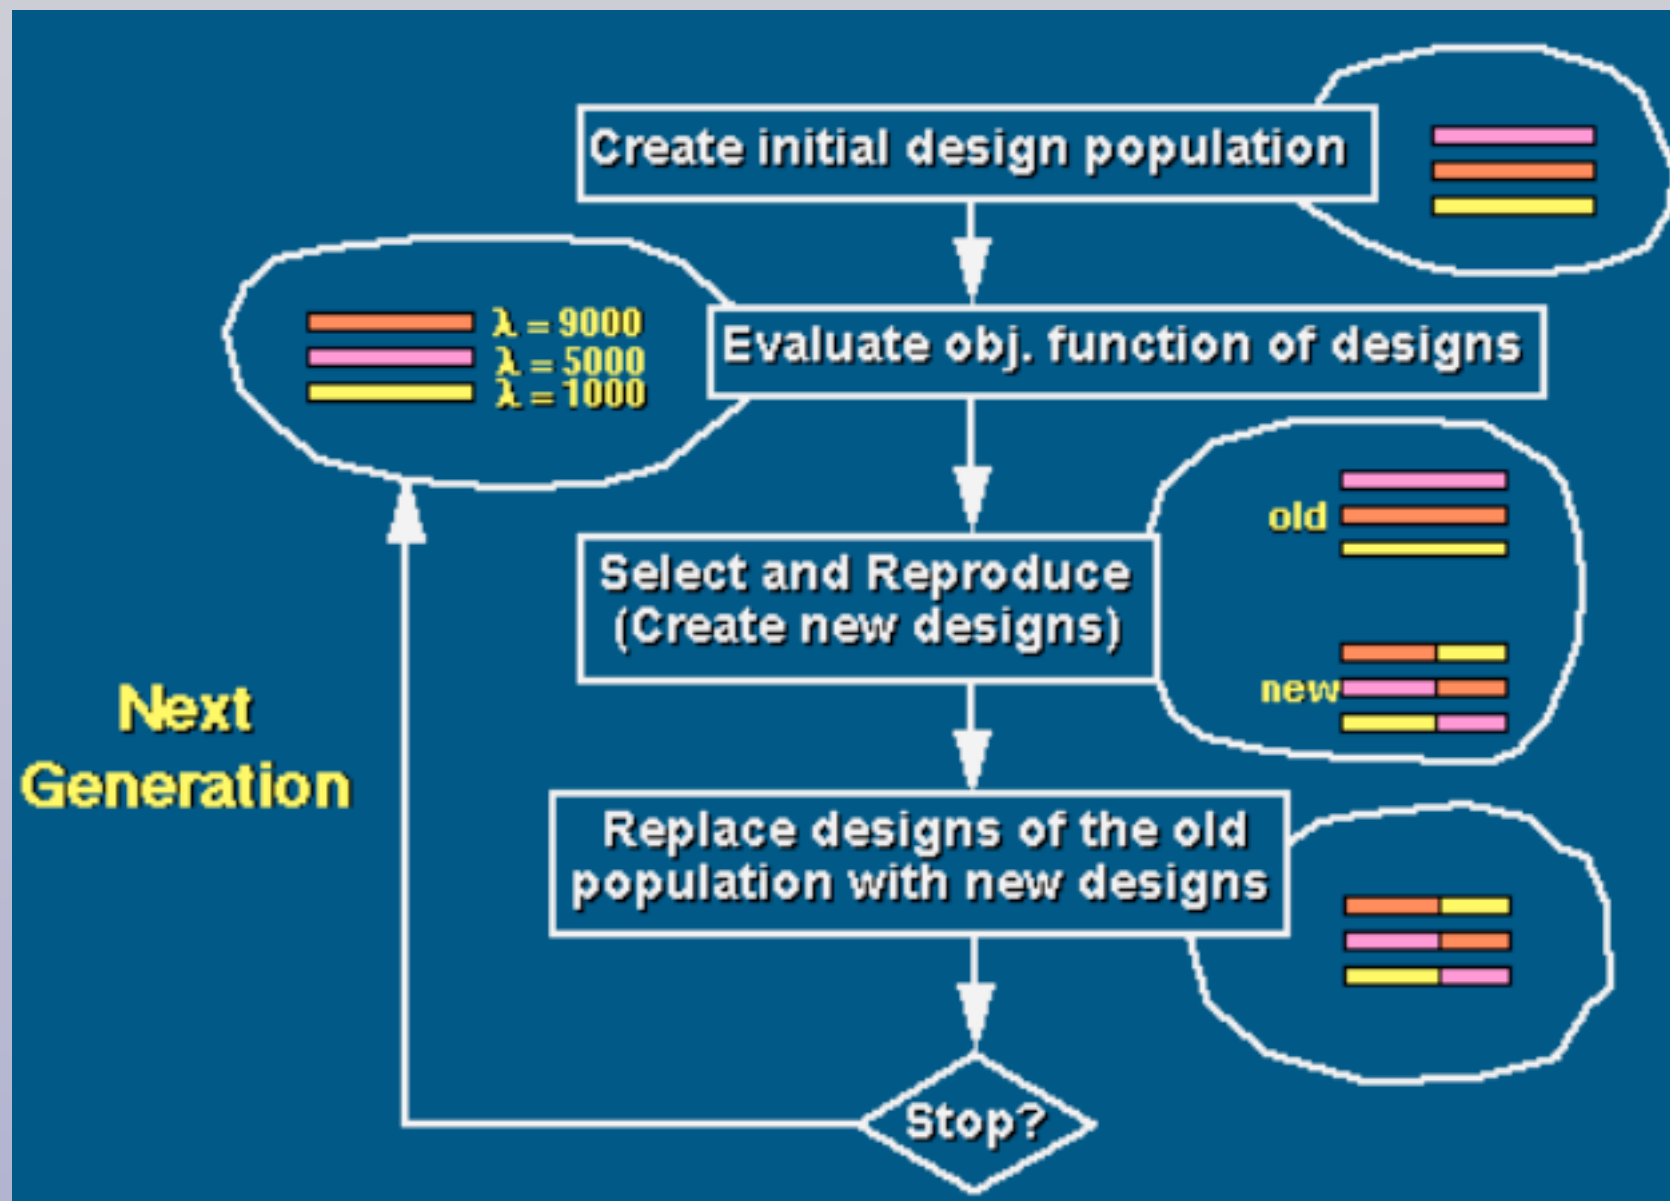

# Filtering Noise: Cross-Validation Stopping

With a flexible PDF parametrization as ANNs one can reach the point of fitting the statistical fluctuations on the data - on top of the underlying physical law

# PDF Learning: Genetic Algorithms

- Traditional minimization algorithms (ex MINUIT) are not suitable to **explore huge minima space**
- Genetic Algorithms** provide a **combination** of **stochastic elements** applied under **deterministic rules** which improve optimization efficiency in problems with many extrema

- A first random set of possible solutions is encoded into **chromosomes**
- This initial population undergoes a series of **mutations** and **crossings**, breeding a next generation of individuals
- The **fitness** for each individual is evaluated, and according to that a **selection** process follows
- The process is **iterated** until some convergence criterion is satisfied
- Closely inspired in **Darwinian evolution**

# Filtering Noise: Cross-Validation Stopping

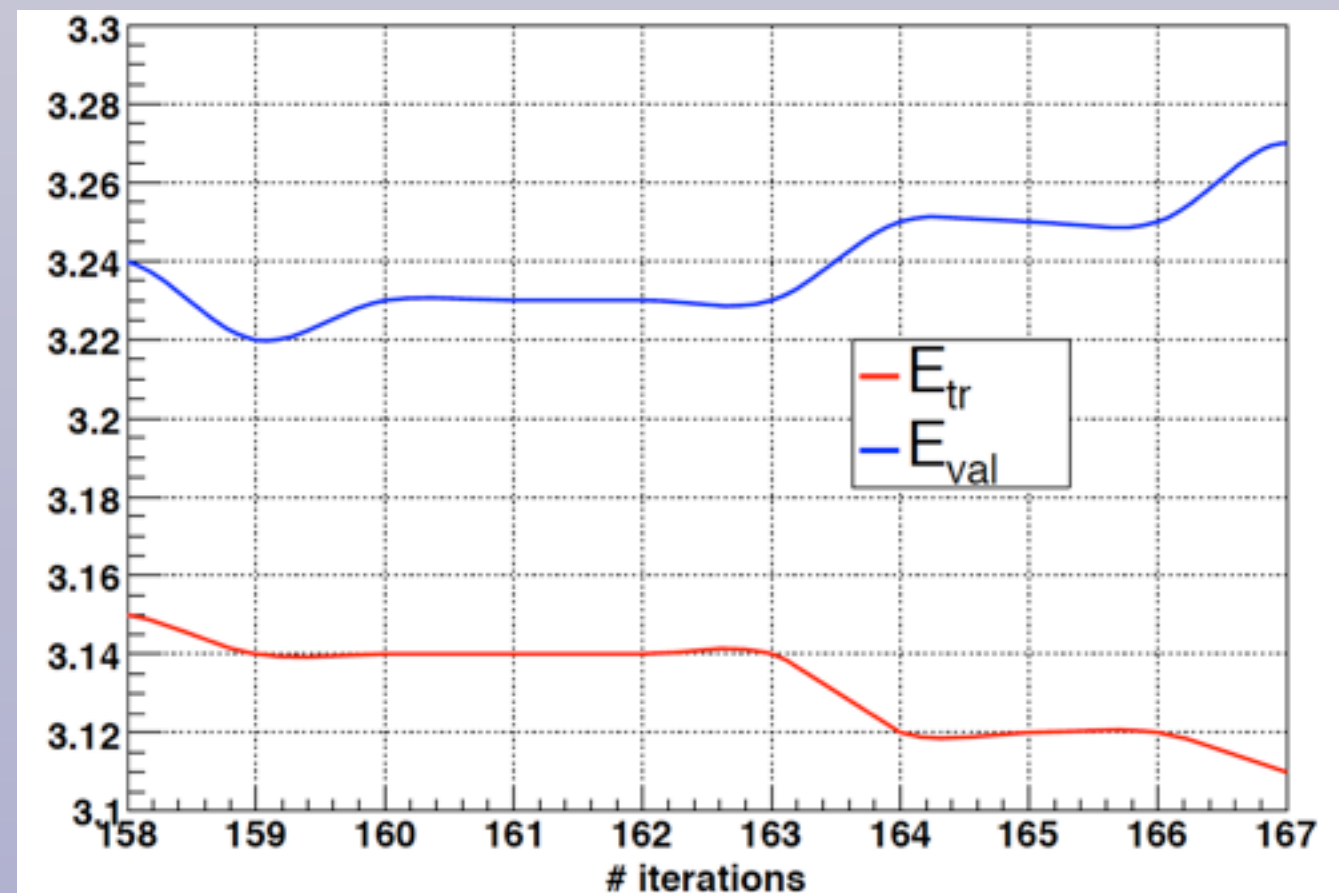

With a **flexible PDF parametrization** as ANNs one can reach the point of fitting the **statistical fluctuations** on the data - on top of the **underlying physical law**

To avoid this, we use the **cross-validation method**: separate data into two disjoint sets

- ✓ The **training** set, which is used in the minimization for the neural networks
- ✓ The **validation** set, which is only monitored but not used in the fit

The **optimal stopping point** is the one where the fit **quality to the validation set stops improving**: this implies one is fitting the **training set statistical fluctuations**

Training and validation  $\chi^2$  as a function of # of GA iterations

# Parton Distributions at the LHC

Various collaborations provide regular updates of their PDF determinations:

# Determination of Standard Model parameters

- 📌 Accurate PDFs are required for **precision determination** of fundamental Standard Model parameters in processes involving initial state hadrons
- 📌 The **strong coupling constant**  $\alpha_s$  can be determined from a global PDF analysis, mostly from scaling violations in Deep-Inelastic Scattering and in inclusive jet production
- 📌 The NNPDF result is the **most accurate determination** of  $\alpha_s$  from a QCD global fit, and nicely consistent with the latest PDG average, to which is one of the dominant contributions
- 📌 In the pipeline:  $\alpha_s$  determinations from LHC data at the **higher scales** ever probed

PDG 2012 average

$$\alpha_s(M_Z^2) = 0.1184 \pm 0.0007$$

NNPDF2.1 NNLO

$$\alpha_s^{\text{NNLO}}(M_Z) = 0.1173 \pm 0.0007^{\text{stat}} \pm 0.0001^{\text{proc}}$$

NNPDF, arXiv:1110.2483

PDG average from PDF fits

- 📌 Consistency check of the global PDF framework: the distributions of pulls for  $\alpha_s$  fitted to **individual experiments** follows a Gaussian distribution

# Impact of Tevatron and LHC data

Inclusive jets pin down large- $x$  gluon

Drell-Yand and  $W, Z$  data determine quark flavor separation

Isolated photon LHC data constraints gluons at medium- $x$ :  
relevant for Higgs production in gluon fusion

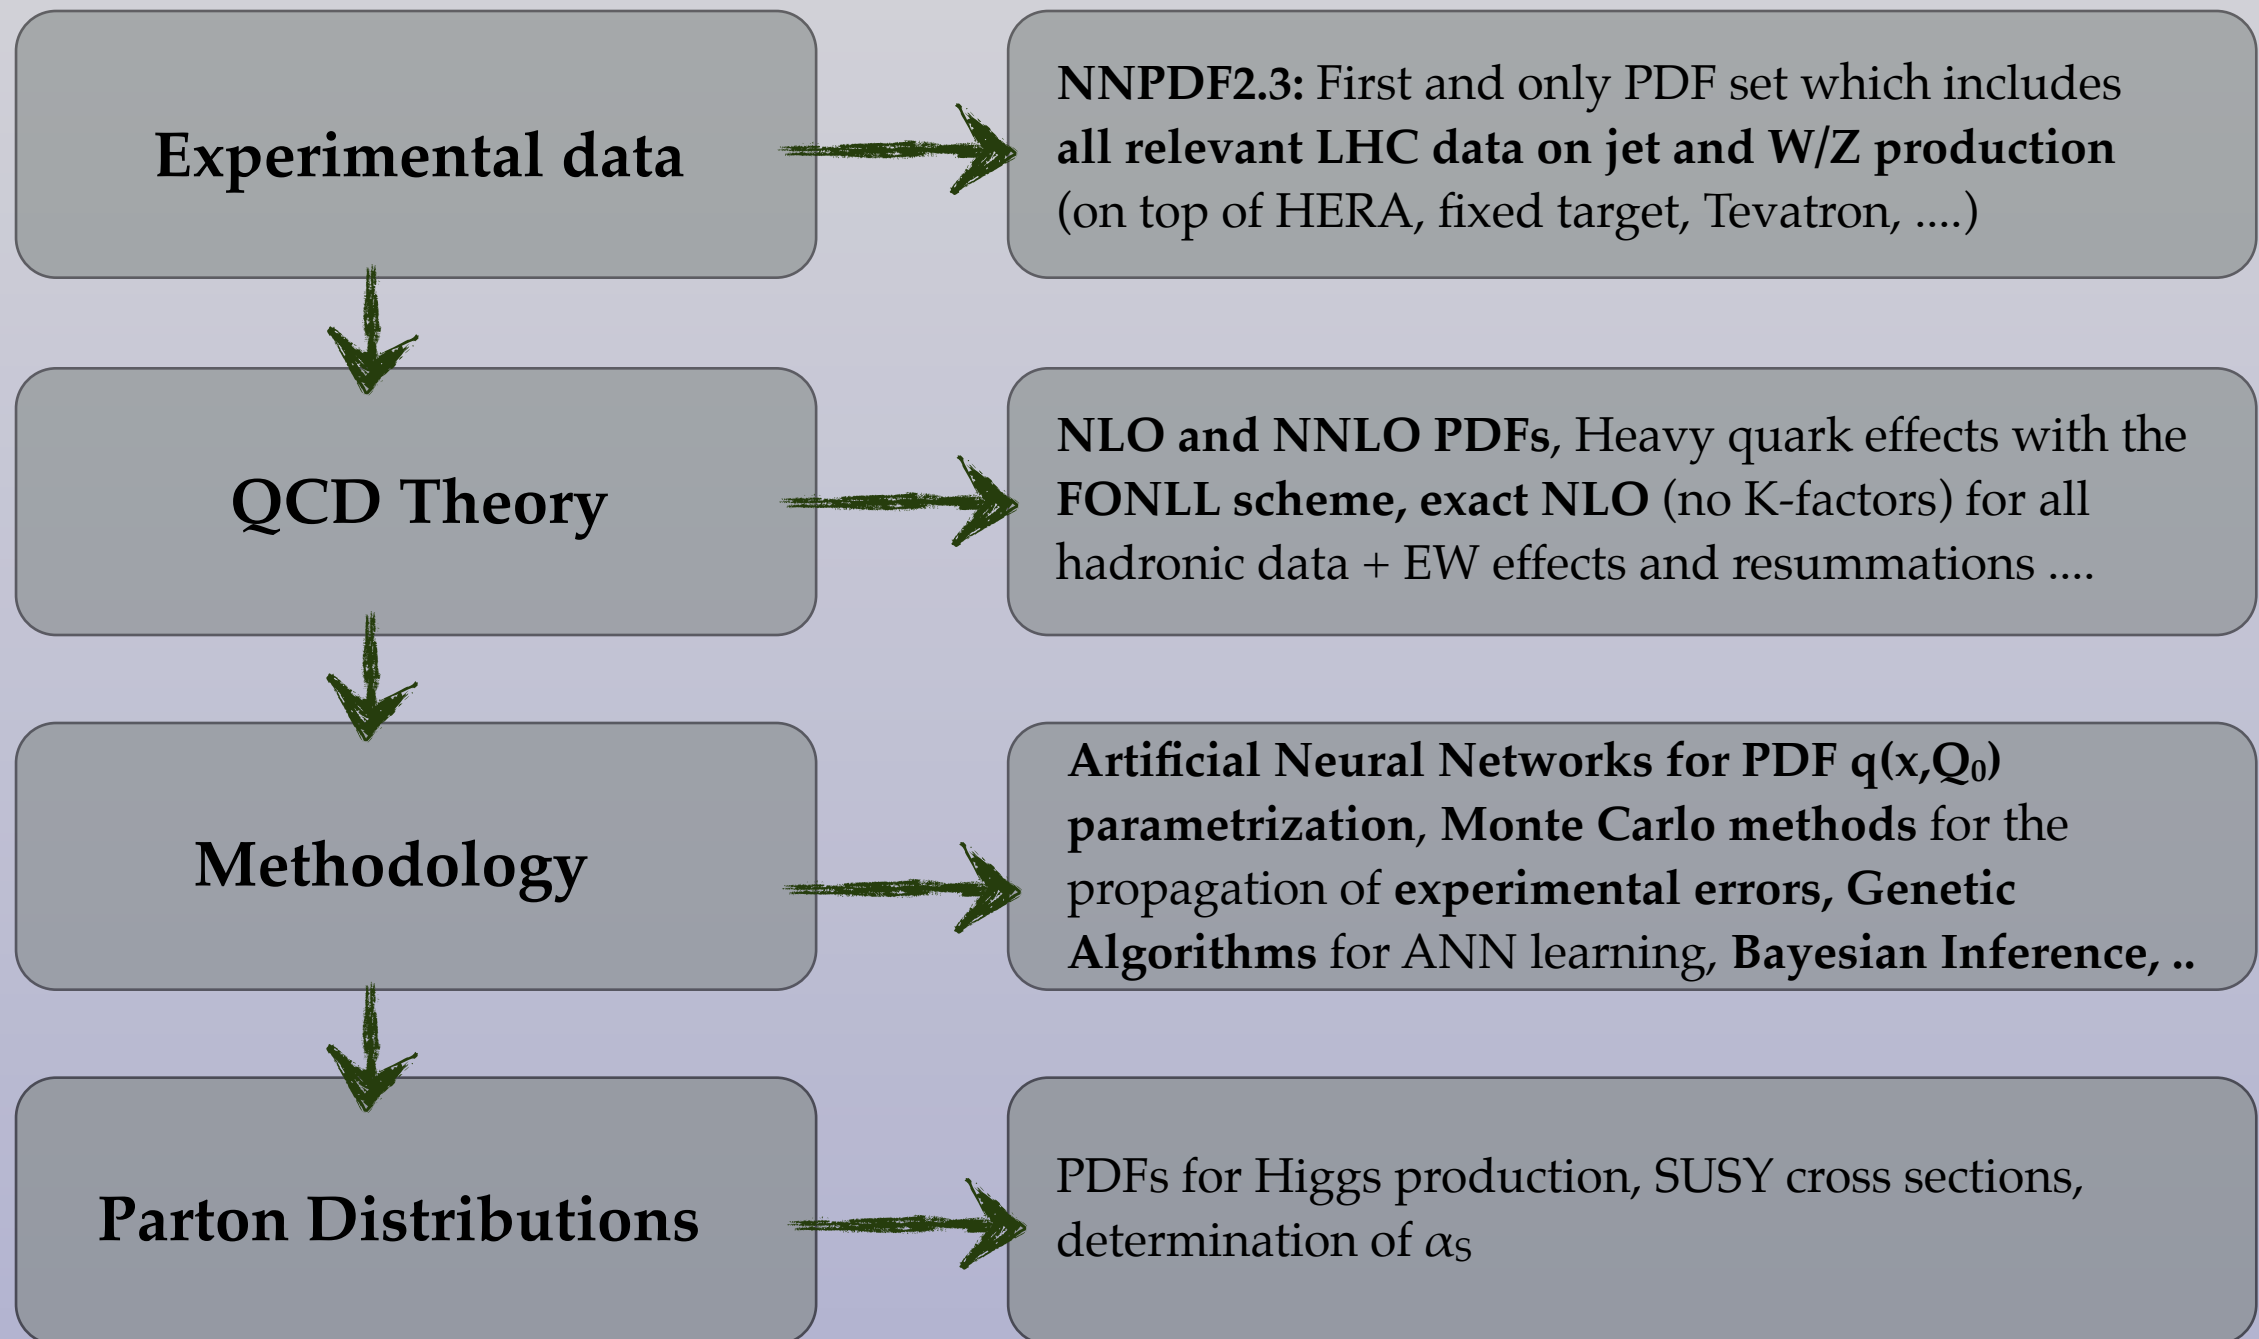

$W$  production in association with charm quarks  
provides direct access to the proton strangeness

# (Neural Network) PDF determination

The NNPDF approach aims to improve on the shortcomings of standard PDF determinations, with the use of a modern robust statistical methodology coupled to the most updated theoretical information and all the relevant hard scattering data, including LHC data

All NNPDF sets available from the LHAPDF library and our HepForge website:

<http://nnpdf.hepforge.org/>

# Experimental data in global PDF fits

$Q^2$  dependence of PDFs:  
determined by pQCD

$x$  dependence of PDFs:  
determined from data

A **global dataset** covering a wide set of hard-scattering observables is required to constrain **all possible PDF combinations** in the **whole range of Bjorken- $x$**

For example, **inclusive jets** are sensitive to the **large- $x$  gluon**, while **HERA neutral current data** pins down the **small- $x$  quarks**

**LHC data** is introducing completely new observables to be used for PDF constraints

Process	Subprocess	Partons	$x$ range
$\ell^\pm \{p, n\} \rightarrow \ell^\pm X$	$\gamma^* q \rightarrow q$	$q, \bar{q}, g$	$x \gtrsim 0.01$
$\ell^\pm n/p \rightarrow \ell^\pm X$	$\gamma^* d/u \rightarrow d/u$	$d/u$	$x \gtrsim 0.01$
$pp \rightarrow \mu^+ \mu^- X$	$u\bar{u}, d\bar{d} \rightarrow \gamma^*$	$\bar{q}$	$0.015 \lesssim x \lesssim 0.35$
$pn/pp \rightarrow \mu^+ \mu^- X$	$(u\bar{d})/(u\bar{u}) \rightarrow \gamma^*$	$\bar{d}/\bar{u}$	$0.015 \lesssim x \lesssim 0.35$
$\nu(\bar{\nu}) N \rightarrow \mu^-(\mu^+) X$	$W^* q \rightarrow q'$	$q, \bar{q}$	$0.01 \lesssim x \lesssim 0.5$
$\nu N \rightarrow \mu^- \mu^+ X$	$W^* s \rightarrow c$	$s$	$0.01 \lesssim x \lesssim 0.2$
$\bar{\nu} N \rightarrow \mu^+ \mu^- X$	$W^* \bar{s} \rightarrow \bar{c}$	$\bar{s}$	$0.01 \lesssim x \lesssim 0.2$
$e^\pm p \rightarrow e^\pm X$	$\gamma^* q \rightarrow q$	$g, q, \bar{q}$	$0.0001 \lesssim x \lesssim 0.1$
$e^+ p \rightarrow \bar{\nu} X$	$W^+ \{d, s\} \rightarrow \{u, c\}$	$d, s$	$x \gtrsim 0.01$
$e^\pm p \rightarrow e^\pm c\bar{c} X$	$\gamma^* c \rightarrow c, \gamma^* g \rightarrow c\bar{c}$	$c, g$	$0.0001 \lesssim x \lesssim 0.01$
$e^\pm p \rightarrow \text{jet} + X$	$\gamma^* g \rightarrow q\bar{q}$	$g$	$0.01 \lesssim x \lesssim 0.1$
$p\bar{p} \rightarrow \text{jet} + X$	$gg, qg, qq \rightarrow 2j$	$g, q$	$0.01 \lesssim x \lesssim 0.5$
$p\bar{p} \rightarrow (W^\pm \rightarrow \ell^\pm \nu) X$	$ud \rightarrow W, \bar{u}\bar{d} \rightarrow W$	$u, d, \bar{u}, \bar{d}$	$x \gtrsim 0.05$
$p\bar{p} \rightarrow (Z \rightarrow \ell^+ \ell^-) X$	$uu, dd \rightarrow Z$	$d$	$x \gtrsim 0.05$

MSTW08, arXiv:0901.0002

# Artificial Neural Networks

Example 1: **Pattern recognition.** During the Yugoslavian wars, the NATO used ANNs to recognize hidden military vehicles

A military aircraft is identified, despite being hidden below a commercial plane.

Many other applications of ANN in **pattern recognition**: OCR software, hand writing recognition, automated anti-plagiarism software, .....

Example 2: **Marketing.** A bank wants to offer a new credit card to their clients. Two possible strategies:

- 📌 **Contact all customers:** slow and costly
- 📌 Contact 5% of the customers, **train a ANN** with **their input** (sex, income, loans) and **their output** (yes/no) and use the information to contact only clients likely to accept the offer

**Cost-effective method** to improve marketing performance

# Artificial Neural Networks

📌 Inspired by **biological brain models**, **Artificial Neural Networks (ANNs)** are **mathematical algorithms** widely used in a wide range of applications, from **high energy physics** to **targeted marketing** and **finance forecasting**

**Biological NeuralNets** →

Neurons, axions,  
synapses, ...

← **Artificial NeuralNets**

📌 Artificial neural networks aimed to excel in the same domains as their biological counterparts: **pattern recognition**, **forecasting**, **classification**, .... where our **evolution-driven biology** outperforms traditional algorithms

# PDF Replica Neural Network Learning

- 📌 Now we can combine all the NNPDF methodology together:
  - 📌 **Artificial Neural Networks** as unbiased interpolants,
  - 📌 **Monte Carlo PDF replicas** for error estimation and propagation,
  - 📌 **Genetic Algorithms** for neural network learning,
  - 📌 **Dynamical Cross-Validation Stopping** .....
- 📌 .... and see how the NNPDF determination works **live** ....

# PDF Replica Neural Network Learning

Each **green curve** corresponds to a gluon PDF Monte Carlo replica

$x g(x, Q^2 = 2 \text{ GeV}^2)$

# PDF Replica Neural Network Learning

PDF uncertainty band defined as 68% Confidence Level over Monte Carlo replica sample

$x \ g(x, Q^2 = 2 \text{ GeV}^2)$

$x \ \Delta s(x, Q^2 = 2 \text{ GeV}^2)$

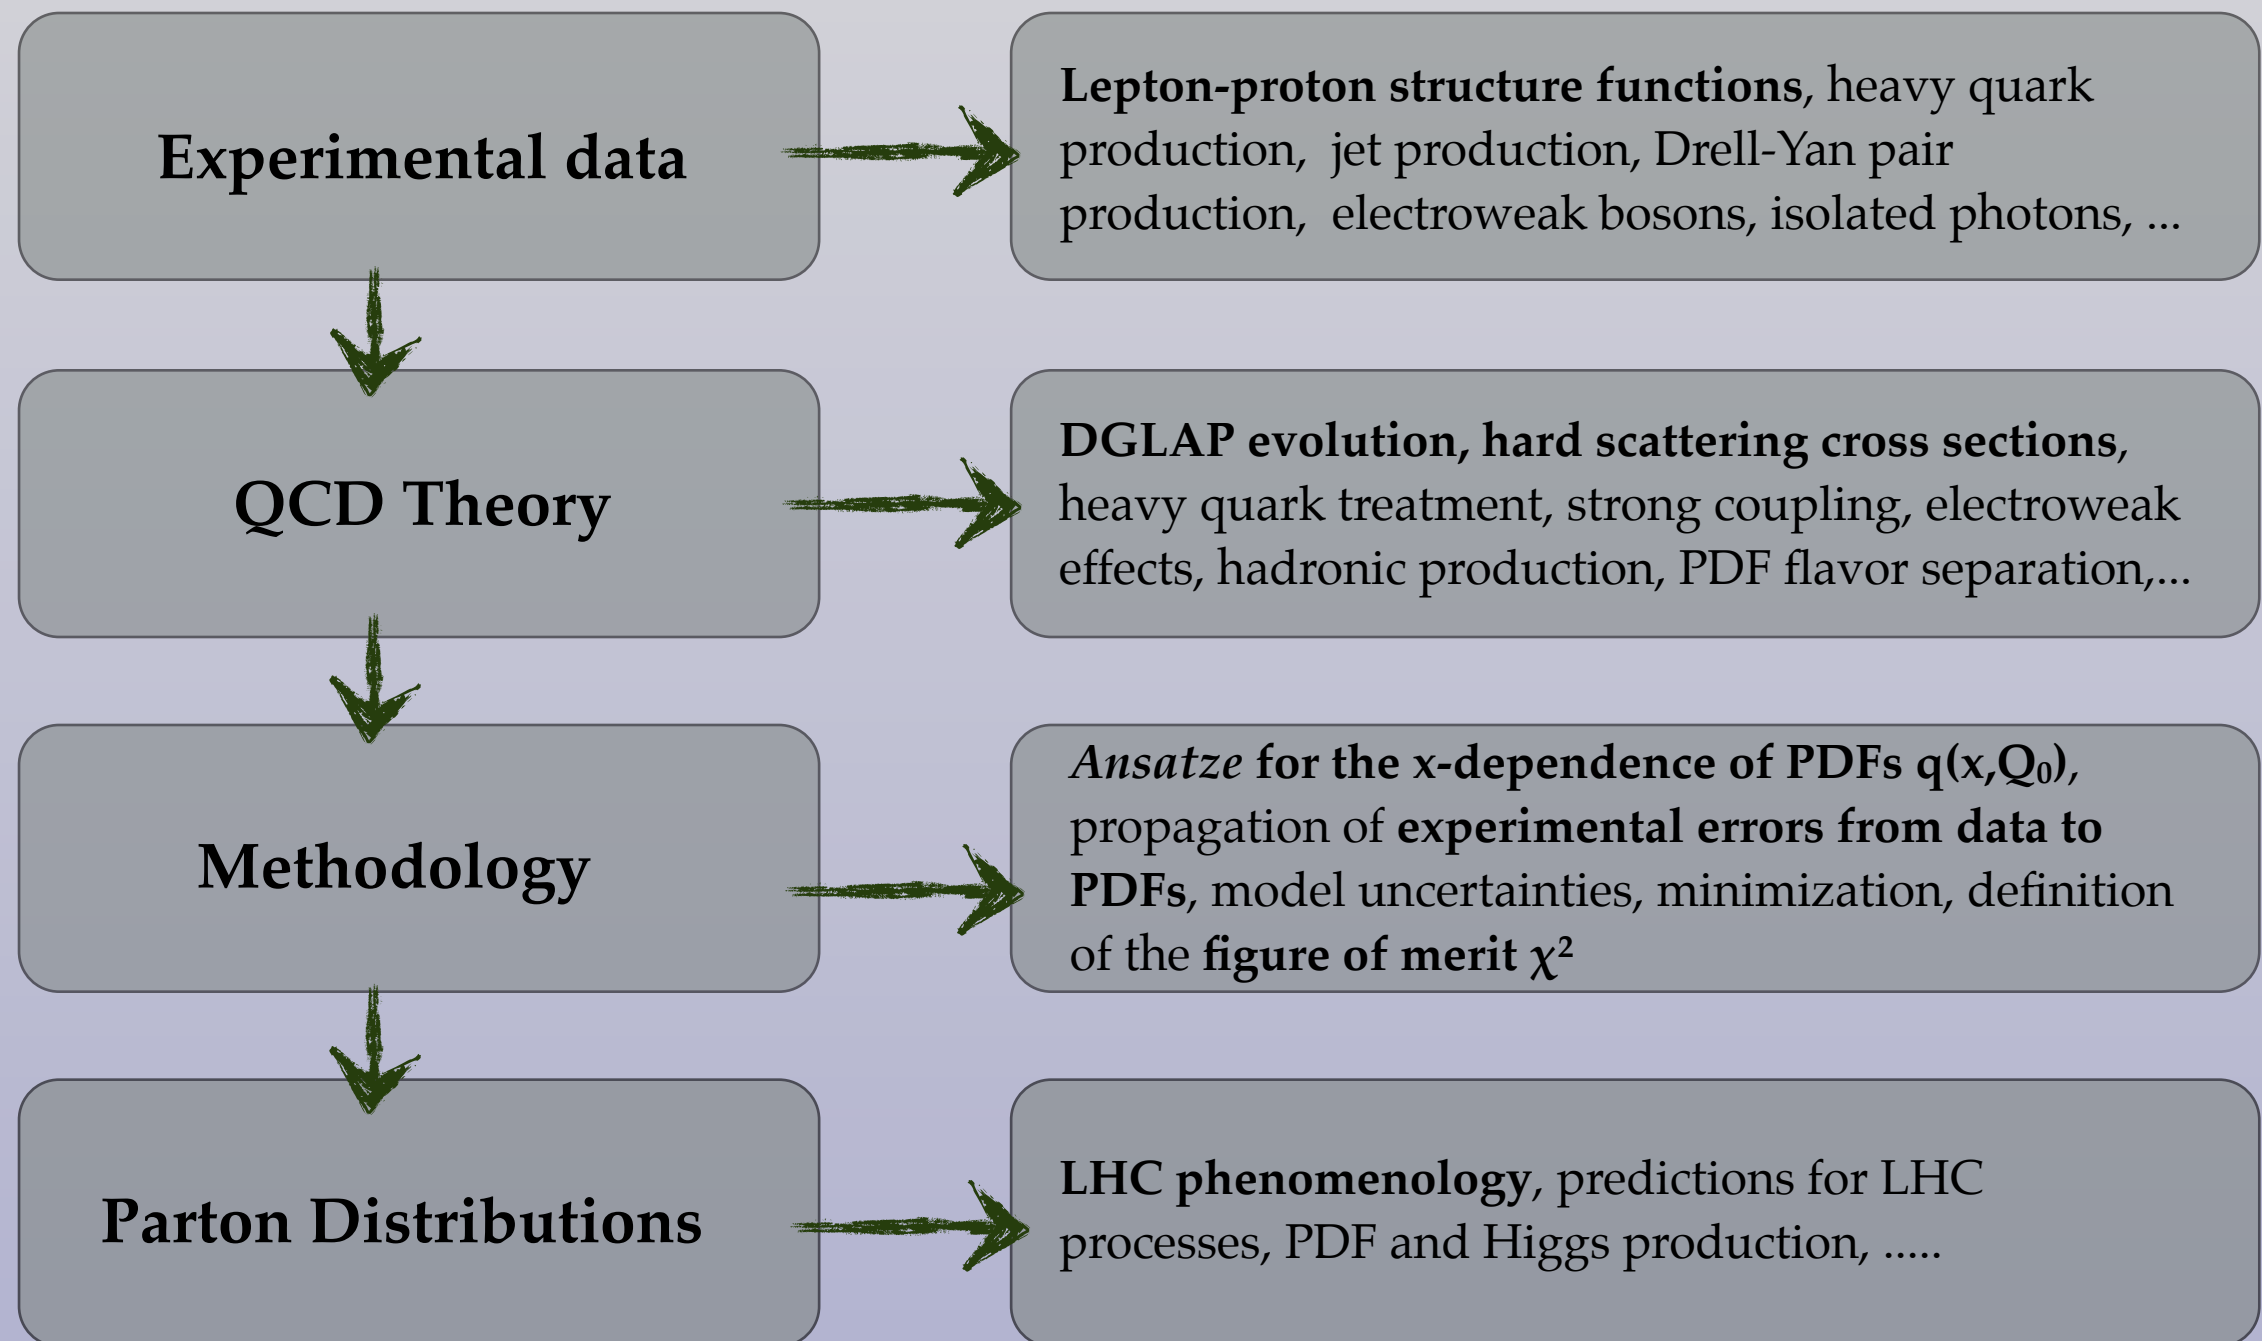

# Higgs Boson Production

- PDF uncertainties in Higgs production are comparable to other theory uncertainties (like missing higher orders), **larger in some cases**
- Thus **improving the precision of PDF determination** is an important ingredient of the Higgs characterization program
- Differences between PDF sets often larger than nominal uncertainty

# PDF determination

PDF determination is based on a **global analysis of hard scattering data** to extract, thanks to the factorization theorem, **universal PDFs for LHC predictions**

All modern PDF sets available from the **LHAPDF** library

# PDF Uncertainties: The Monte Carlo Method

- Generate a large number of Monte Carlo replicas of the experimental data with the same underlying probability distribution

$$F_{I,p}^{(\text{art})}(k) = \underset{\text{lumi error}}{S_{p,N}^{(k)}} \underset{\text{random numbers}}{F_{I,p}^{(\text{exp})}} \left( 1 + \sum_{l=1}^{N_c} \underset{\text{stat error}}{r_{p,l}^{(k)}} \underset{\text{sys errors}}{\sigma_{p,l}} + r_p^{(k)} \sigma_{p,s} \right), \quad k = 1, \dots, N_{\text{rep}} \gg 1$$

- Perform a **PDF determination** on each of these MC replicas
- The set of PDF replicas form a **representation of the probability density in the space of parton distribution functions**
- PDF uncertainties can be propagated to physical cross sections using **textbook statistics**, no need of linear / gaussian assumptions

**Central PDF prediction =  
Expectation Value of MC sample**

$$\langle \mathcal{O} \rangle = \int \mathcal{O}[f] \mathcal{P}(f) Df = \frac{1}{N} \sum_{k=1}^N \mathcal{O}[f_k]$$

**PDF Uncertainty = Standard  
Deviation of MC sample**

$$\Delta f = \sqrt{\frac{1}{N} \sum_{k=1}^N f_k^2 - \left( \frac{1}{N} \sum_{k=1}^N f_k \right)^2}$$
